# About Kaspersky Embedded Systems Security

Kaspersky Embedded Systems Security protects computers and other embedded systems under Microsoft® Windows® (hereinafter also referred to as protected devices) against viruses and other computer threats. Kaspersky Embedded Systems Security users are corporate network administrators and specialists responsible for anti-virus protection of the corporate network.

You can install Kaspersky Embedded Systems Security on a variety of embedded systems under Windows, including the following device types:

- ATM (automated tellers machines)
- POS (points of sales)

Kaspersky Embedded Systems Security can be managed in the following ways:

- Via the Application Console installed on the same protected device as Kaspersky Embedded Systems Security, or on a different device
- Using commands in the command line
- Via the Kaspersky Security Center Administration Console

The Kaspersky Security Center application can also be used for centralized administration of multiple protected devices running Kaspersky Embedded Systems Security.

It is possible to review Kaspersky Embedded Systems Security performance counters for the "System Monitor" application, as well as SNMP counters and traps.

## Kaspersky Embedded Systems Security components and functions

The application includes the following components:

- **Real-Time File Protection.** Kaspersky Embedded Systems Security scans objects when they are accessed. Kaspersky Embedded Systems Security scans the following objects:
  - Files
  - Alternate file system streams (NTFS streams)
  - Master boot records and boot sectors on local hard and removable drives
- **On-Demand Scan.** Kaspersky Embedded Systems Security runs a single scan of the specified area for viruses and other computer security threats. Application scans files, RAM, and autorun objects on a protected device.
- **Applications Launch Control.** The component tracks users' attempts to launch applications and controls applications launches on a protected device.
- **Device Control.** The component controls registration and usage of external devices in order to protect the device against computer security threats that may arise while exchanging files with USB-connected flash drives or other types of external device.
- **Firewall Management.** This component provides the ability to manage the Windows Firewall: configure settings and operating system firewall rules, and block any possibility of external firewall configuration.

- **File Integrity Monitor.** Kaspersky Embedded Systems Security detects changes in files within the monitoring scopes specified in the task settings. These changes may indicate a security breach on the protected device.
- **Log Inspection.** This component monitors the integrity of the protected environment based on the results of an inspection of Windows event logs.

The following functions are implemented in the application:

- **Database Update and Software Modules Update.** Kaspersky Embedded Systems Security downloads updates of application databases and modules from Kaspersky's FTP or HTTP update servers, Kaspersky Security Center Administration Server, or other update sources.
- **Quarantine.** Kaspersky Embedded Systems Security quarantines probably infected objects by moving such objects from their original location to the *Quarantine* folder. For security purposes, objects in the Quarantine folder are stored in encrypted form.
- **Backup.** Kaspersky Embedded Systems Security stores encrypted copies of objects classified as *Infected* in *Backup* before disinfecting or deleting them.
- **Administrator and user notifications.** You can configure the application to notify the administrator and users who access the protected device about events in Kaspersky Embedded Systems Security operation and the status of anti-virus protection on the device.
- **Importing and exporting settings.** You can export Kaspersky Embedded Systems Security settings to an XML configuration file and import settings into Kaspersky Embedded Systems Security from the configuration file. You can save all application settings or only settings for individual components to a configuration file.
- **Applying templates.** You can manually configure a node's security settings in the tree or in a list of the protected device's file resources, and save the configured setting values as a template. This template can then be used to configure the security settings of other nodes in Kaspersky Embedded Systems Security protection and scan tasks.
- **Managing access permissions for Kaspersky Embedded Systems Security functions.** You can configure the rights to manage Kaspersky Embedded Systems Security and the Windows services registered by the application, for users and groups of users.
- **Writing events to the Windows Event Log.** Kaspersky Embedded Systems Security logs information about software component settings, the current status of tasks, events that occur while tasks run, events associated with Kaspersky Embedded Systems Security management, and information required to diagnose errors in Kaspersky Embedded Systems Security.
- **Trusted Zone.** You can generate a list of exclusions from the protection or scan scope, that Kaspersky Embedded Systems Security will apply in the On-Demand and Real-Time Computer Protection tasks.
- **Exploit Prevention.** You can protect process memory from exploits using an Agent injected into the process.

Updates functionality (including providing anti-virus signature updates and codebase updates), as well as KSN functionality may not be available in the software in the U.S.

## What's new

The new version of Kaspersky Embedded Systems Security introduces the following new features and improvements:

- The following [operating systems](#) are now supported:
  - Windows 10 22H2
  - Windows 11 22H2
- In the [Device Control task](#), you can use masks for the rules scope, allow access to the devices only for trusted users or group of users, and create the rules based on data from the Kaspersky Security Center network list of the added devices.
- The set of triggering criteria for the [Application Launch Control task](#) is extended: you can launch the programs via the defined command line and you can select multiple criteria.
- A new component for scanning executable scripts using [AMSI technology](#) for Windows is introduced.
- [Firewall Management task](#): outbound connections rules are added, along with ICMPv4 and ICMPv6 connections management.
- The [Malfunction diagnosis section](#) is introduced for Kaspersky Security Center policies: you can manage trace files settings and dump files settings. Also, you can manage these options using command line utility kavshell.exe and using the installer command line setup.exe during installation. Trace management options and dump management options for the device under protection of Kaspersky Embedded Systems Security are available in Kaspersky Security Center remote diagnostic utility.
- During installation, you can select the scope of saved data for migration to a new version of Kaspersky Embedded Systems Security using the installer command line.
- The following [prerequisite for the product installation](#) is added: the operating system must support certificates with SHA-256 signatures.
- Publishing events into Windows Event Log is added for the Log Inspection task.
- Database update tasks are created automatically during installation for all types of installation packages (with anti-virus databases and without anti-virus databases).

The application release is cumulative and includes the resolved issues from earlier releases.

# Sources of information about Kaspersky Embedded Systems Security

This section lists sources of information about the application.

You can select the most suitable information source, depending on the importance level and urgency of the issue.

## Sources for independent retrieval of information

You can use the following sources to find information about Kaspersky Embedded Systems Security:

- Kaspersky Embedded Systems Security page on the Kaspersky website.
- Kaspersky Embedded Systems Security page on the Technical Support website (Knowledge Base).
- Manuals.

If you did not find a solution to your problem, contact [Kaspersky Technical Support](#).

An Internet connection is required to use online information sources.

### Kaspersky Embedded Systems Security page on the Kaspersky website

On the [Kaspersky Embedded Systems Security page](#), you can view general information about the application, its functions and features.

The Kaspersky Embedded Systems Security page contains a link to eStore. There you can purchase the application or renew your license.

### Kaspersky Embedded Systems Security page in Knowledge Base

Knowledge Base is a section on the Technical Support website.

The Kaspersky Embedded Systems Security page in the [Knowledge Base](#) features articles that provide useful information, recommendations, and answers to frequently asked questions about how to purchase, install, and use the application.

Knowledge Base articles can answer questions relating to not only Kaspersky Embedded Systems Security but also to other Kaspersky applications. Knowledge Base articles can also include Technical Support news.

### Kaspersky Embedded Systems Security documentation

Kaspersky Embedded Systems Security Administrator's Guide contains information about the application installation, uninstallation, settings configuring and usage.

## Discussing Kaspersky applications on the Forum

You can discuss questions related to Kaspersky applications with other users and Kaspersky experts on our [Forum](#).

On the Forum, you can view existing topics, leave comments, and create new discussion topics.

# Kaspersky Embedded Systems Security

This section describes the functions, components, and distribution kit of Kaspersky Embedded Systems Security, and provides a list of hardware and software requirements of Kaspersky Embedded Systems Security.

## Distribution kit

The distribution kit includes the welcome application that lets you do the following:

- Start the Kaspersky Embedded Systems Security Installation Wizard.
- Start the Kaspersky Embedded Systems Security Console Installation Wizard.
- Start the Installation Wizard that will install Kaspersky Embedded Systems Security Administration Plug-in for managing the application via the Kaspersky Security Center.
- Go to Kaspersky Embedded Systems Security page on the Kaspersky website.
- Visit the [Technical Support website](#).
- Read information about the current version of Kaspersky Embedded Systems Security.

The \console folder contains files for the installation of Application Console ("Kaspersky Embedded Systems Security Administration Tools" set of components).

The \product folder contains:

- Files for the installation of Kaspersky Embedded Systems Security components on a protected device running a 32-bit or 64-bit Microsoft Windows operating system.
- File for the installation of the Administration Plug-in for managing Kaspersky Embedded Systems Security via the Kaspersky Security Center.
- Archive of anti-virus databases current at the time the application was released.
- File with the text of the End User License Agreement and Privacy Policy.

The \product\_no\_avbases folder contains the installation files for Kaspersky Embedded Systems Security components and the Administration Plug-in without the anti-virus databases.

The \setup folder contains greeting program start files.

The distribution kit files are stored in the different folders depending on their intended use (see table below).

Kaspersky Embedded Systems Security distribution kit files

File	Purpose
autorun.inf	Autorun file for the Kaspersky Embedded Systems Security Installation Wizard when installing the application from removable drive.
release_notes.txt	The file contains release information.
migration.txt	The file describes migration from previous application versions.

setup.exe	Greeting program start file (starts setup.hta).
\console\esstools_x86.msi	Windows Installer package; installs the Application Console on the protected device running a 32-bit Microsoft Windows operating system.
\console\esstools_x64.msi	Windows Installer package; installs the Application Console on the protected device running a 64-bit Microsoft Windows operating system.
\console\setup.exe	The file that starts the setup wizard for the "Administration tools" set of components (including the Application Console); it starts the esstools.msi installation package file using the settings specified in the setup wizard.
\product\bases.cab	Archive of anti-virus databases current at the time of application release.
\product\setup.exe	The file for installing Kaspersky Embedded Systems Security on the protected device by means of the wizard; it starts the installation package file ess.msi with the installation settings specified in the wizard.
\product\ess_x86.msi	<p>Windows Installer package; installs the <a href="#">Protect computer with Anti-Virus Bases</a> configuration of Kaspersky Embedded Systems Security on the protected device running a 32-bit Microsoft Windows operating system.</p> <div style="border: 1px solid #ccc; padding: 10px; background-color: #f9f9f9;"> <p>If the Protect computer with Anti-Virus Bases configuration is selected, all Kaspersky Embedded Systems Security components are included by default except the Firewall Management and Performance Counters components.</p> <p>When you install the Protect computer with Anti-Virus Bases configuration of Kaspersky Embedded Systems Security over the application version that does not use signature analysis and anti-virus databases to protect your computer, the set of application components will be automatically expanded by adding the following components:</p> <ul style="list-style-type: none"> <li>• Real-Time File Protection</li> <li>• On-Demand Scan</li> <li>• Network Threat Protection</li> </ul> </div>
\product\ess_x64.msi	Windows Installer package; installs the <a href="#">Protect computer with Anti-Virus Bases</a> configuration of Kaspersky Embedded Systems Security on the protected device running a 64-bit Microsoft Windows operating system.

	<p>If the Protect computer with Anti-Virus Bases configuration is selected, all Kaspersky Embedded Systems Security components are included by default except the Firewall Management and Performance Counters components.</p> <p>When you install the Protect computer with Anti-Virus Bases configuration of Kaspersky Embedded Systems Security over the application version that does not use signature analysis and anti-virus databases to protect your computer, the set of application components will be automatically expanded by adding the following components:</p> <ul style="list-style-type: none"> <li>• Real-Time File Protection</li> <li>• On-Demand Scan</li> <li>• Network Threat Protection</li> </ul>
\product\ess.kud	File in Kaspersky Unicode Definition format with a description of the installation package for remote installation of Kaspersky Embedded Systems Security via Kaspersky Security Center.
\product\klcfginst.exe	Installer for Administration Plug-in for managing Kaspersky Embedded Systems Security via the Kaspersky Security Center. Install the Administration Plug-in on each protected device where the Kaspersky Security Center Administration Console is installed if you plan to use it to manage Kaspersky Embedded Systems Security.
\product\license.txt	Text of the End User License Agreement and Privacy Policy.
\product_long_term\setup.exe	The file for installing Kaspersky Embedded Systems Security on the protected device by means of the wizard; it starts the installation package file ess.msi with the installation settings specified in the wizard.
\product_long_term\ess_x86.msi	Windows Installer package; installs the <a href="#">Protect computer with Default Deny technology</a> configuration of Kaspersky Embedded Systems Security on the protected device running a 32-bit Microsoft Windows operating system.

The components enabling updates are not included in the Protect computer with Default Deny technology configuration.

If the Protect computer with Default Deny technology configuration is selected, the following components are included by default:

- Core
- Exploit Prevention
- Application Launch Control
- System Tray Icon

When you install the Protect computer with Default Deny technology configuration of Kaspersky Embedded Systems Security over the application version that uses signature analysis and anti-virus databases to protect your computer, the set of application components will be automatically reduced by removing the following components:

- Real-Time File Protection
- On-Demand Scan
- the components enabling updates

This configuration is recommended for protecting systems with limited resources. In this case, you can activate the application for a long term, and the Applications Launch Control component provides computer protection.

\\product\_long\_term\ess\_x64.msi

Windows Installer package; installs the [Protect computer with Default Deny technology](#) configuration of Kaspersky Embedded Systems Security on the protected device running a 64-bit Microsoft Windows operating system.

The components enabling updates are not included in the Protect computer with Default Deny technology configuration.

If the Protect computer with Default Deny technology configuration is selected, the following components are included by default:

- Core
- Exploit Prevention
- Application Launch Control
- System Tray Icon

When you install the Protect computer with Default Deny technology configuration of Kaspersky Embedded Systems Security over the application version that uses signature analysis and anti-virus databases to protect your computer, the set of application components will be automatically reduced by removing the following components:

- Real-Time File Protection
- On-Demand Scan
- the components enabling updates

This configuration is recommended for protecting systems with limited resources. In this case, you can activate the application for a long term, and the Applications Launch Control component provides computer protection.

\product_long_term\ess_light.kud	File in Kaspersky Unicode Definition format with a description of the installation package for remote installation of Kaspersky Embedded Systems Security via Kaspersky Security Center.
\product_long_term\klcfginst.exe	Installer for Administration Plug-in for managing Kaspersky Embedded Systems Security via the Kaspersky Security Center. Install the Administration Plug-in on each protected device where the Kaspersky Security Center Administration Console is installed if you plan to use it to manage Kaspersky Embedded Systems Security.
\product_long_term\license.txt	Text of the End User License Agreement and Privacy Policy.
\setup\setup.hta	Greeting program start file.

## Hardware and software requirements

Before installing Kaspersky Embedded Systems Security, you must uninstall other anti-virus applications from the device.

## Software requirements for the protected device

You can install Kaspersky Embedded Systems Security on a device under a 32-bit or 64-bit Microsoft Windows operating system.

Windows Installer 3.1 is required for a proper application installation and work on a protected device under Microsoft Windows XP.

To install and use Kaspersky Embedded Systems Security on the protected devices with embedded operating systems, Filter Manager component is required.

For correct operation of Kaspersky Embedded Systems Security, SHA-2 support is required in Windows. For detailed information, see: <https://support.kaspersky.com/15728>.

You can install Kaspersky Embedded Systems Security on a device under one of the following 32-bit or 64-bit Microsoft Windows operating systems:

- Workstations:
  - Windows XP Pro SP2 32-bit / 64-bit
  - Windows XP Pro SP3 32-bit
  - Windows 7 Professional/Enterprise/Ultimate SP1 32-bit / 64-bit
  - Windows 8 Pro/Enterprise 32-bit / 64-bit
  - Windows 8.1 Pro/Enterprise 32-bit / 64-bit
  - Windows 10 version 1507 Home / Pro / Education / Enterprise 32-bit / 64-bit
  - Windows 10 LTSC 2015 version 1507 32-bit / 64-bit
  - Windows 10 RS1 version 1607 Home / Pro / Education / Enterprise 32-bit / 64-bit
  - Windows 10 LTSC 2016 version 1607 32-bit / 64-bit
  - Windows 10 RS2 version 1703 Home / Pro / Education / Enterprise 32-bit / 64-bit
  - Windows 10 RS3 version 1709 Home / Pro / Education / Enterprise 32-bit / 64-bit
  - Windows 10 RS4 version 1803 Home / Pro / Education / Enterprise 32-bit / 64-bit
  - Windows 10 RS5 version 1809 Home / Pro / Education / Enterprise 32-bit / 64-bit
  - Windows 10 LTSC 2019 version 1809 32-bit / 64-bit
  - Windows 10 19H2 version 1909 Home / Pro / Education / Enterprise 32-bit / 64-bit
  - Windows 10 21H2 version 21H2 Home / Pro / Education / Enterprise 32-bit / 64-bit

- Windows 10 LTSC 2021 version 21H2 32-bit / 64-bit
- Windows 10 22H2 version 22H2 Home / Pro / Education / Enterprise 32-bit / 64-bit
- Windows 11 21H2 version 21H2 Home / Pro / Education / Enterprise 64-bit
- Windows 11 22H2 version 22H2 Home / Pro / Education / Enterprise 64-bit
- Embedded systems:
  - Windows XP Embedded SP2 (WEPOS) 32-bit / 64-bit
  - Windows XP Embedded SP3 (POS Ready 2009) 32-bit
  - Windows 7 SP1 Embedded 32-bit / 64-bit
  - Windows Embedded 8.1 Industry Pro 32-bit / 64-bit
  - Windows Embedded 8.0 Industry Pro 32-bit / 64-bit
  - Windows 10 IoT 32-bit / 64-bit

## Hardware requirements for the protected device

Hardware requirements for the protected device vary depending on the installed Windows operating system:

- Hardware requirements for a device under Windows XP (32 / 64-bit), Windows Embedded POS Ready 32-bit, or Windows Embedded POS Ready 7 operating system:
  - Minimum configuration:
    - Disk space requirements:
      - To install the Applications Launch Control component – 50 MB.
      - To install all Kaspersky Embedded Systems Security components – 2 GB.
    - RAM:
      - 256 MB to install only the Applications Launch Control component on the device under Microsoft Windows operating system.
      - 512 MB to perform full installation of all components.
    - Processor requirements:
      - for 32-bit Microsoft Windows operating systems:
 

1.4 GHz single-core processor  
Intel® Pentium® III
      - for 64-bit Microsoft Windows operating systems:
 

1.4 GHz single-core processor

## Intel Pentium IV

- Recommended configuration:
  - Disk space requirements:
    - To install the Applications Launch Control component – 2 GB.
    - To install all Kaspersky Embedded Systems Security components – 4 GB.
  - RAM: 2 GB.
  - Processor requirements: 2.4 GHz quad-core processor.
- Hardware requirements for a device under Windows Embedded 7, Windows Embedded 8 or Windows Embedded 10 operating system:
  - Minimum configuration:
    - Disk space requirements:
      - To install the Applications Launch Control component – 50 MB.
      - To install all Kaspersky Embedded Systems Security components – 2 GB.
    - RAM: 1 GB.
    - Processor requirements: 1.4 GHz single-core processor Intel Pentium IV.
  - Recommended configuration:
    - Disk space requirements:
      - To install the Applications Launch Control component – 2 GB.
      - To install all Kaspersky Embedded Systems Security components – 4 GB.
    - RAM: 2 GB.
    - Processor requirements: 2.4 GHz quad-core processor.
- Hardware requirements for a device under Windows 7 (64-bit), Windows 8 (64-bit), Windows 10 (64-bit) or Windows 11 (64-bit) operating system:
  - Minimum configuration:
    - Disk space requirements:
      - To install the Applications Launch Control component – 50 MB.
      - To install all Kaspersky Embedded Systems Security components – 2 GB.
    - RAM:
      - 1 GB to install only the Applications Launch Control component on the device under Microsoft Windows operating system.

- 2 GB to perform full installation of all components.
- Processor requirements: 1.4 GHz single-core processor Intel Pentium IV.
- Recommended configuration:
  - Disk space requirements:
    - To install the Applications Launch Control component – 2 GB.
    - To install all Kaspersky Embedded Systems Security components – 4 GB.
  - RAM:
    - 2 GB to install only the Applications Launch Control component on the device under Microsoft Windows operating system.
    - 4 GB to perform full installation of all components.
  - Processor requirements: 2.4 GHz quad-core processor.
- Hardware requirements for a device under Windows 7 (32-bit), Windows 8 (32-bit) or Windows 10 (32-bit):
  - Minimum configuration:
    - Disk space requirements:
      - To install the Applications Launch Control component – 50 MB.
      - To install all Kaspersky Embedded Systems Security components – 2 GB.
    - RAM:
      - 256 MB to install only the Applications Launch Control component on the device under Microsoft Windows operating system.
      - 1 GB to perform full installation of all components.
    - Processor requirements:
      - for 32-bit Microsoft Windows operating systems:
        - 1.4 GHz single-core processor
        - Intel Pentium III
      - for 64-bit Microsoft Windows operating systems:
        - 1.4 GHz single-core processor
        - Intel Pentium IV
  - Recommended configuration:
    - Disk space requirements:
      - To install the Applications Launch Control component – 2 GB.

- To install all Kaspersky Embedded Systems Security components – 4 GB.
- RAM: 2 GB.
- Processor requirements: 2.4 GHz quad-core processor.

## Functional requirements and limitations

This section describes additional functional requirements and existing limitations for Kaspersky Embedded Systems Security components.

## Installation and uninstallation

Following is the list of installation and uninstallation limitations:

- For correct operation of Kaspersky Embedded Systems Security, SHA-2 support is required in Windows.
- When you install the application, a warning may appear on the screen if the specified path to the Kaspersky Embedded Systems Security installation folder contains more than 150 characters. The warning does not affect the installation process: you can install and run Kaspersky Embedded Systems Security.
- If you want to install the SNMP protocol support component, make sure to restart the SNMP service if the SNMP service is running.
- If you want to install and run Kaspersky Embedded Systems Security on a device running on an embedded operating system, make sure to install the Filter Manager component.
- You cannot install Kaspersky Embedded Systems Security Administration Tools via Microsoft Active Directory® group policies.
- If you exclude the Anti-virus Protection node from the list of installed application components, this node disappears from the list of available components after the installation is completed. To install the components of the Anti-virus Protection node, start the Installation Wizard from the installation package since the installation package contains a full list of components.
- If Kaspersky Embedded Systems Security Administration Console is installed, the Installation Wizard may prompt to restart the computer. In this case, reboot is not mandatory. It is sufficient to end the session of the user who installed the Administration Console and log in to the system again.
- If you install the application on the protected devices running on older operating systems unable to receive regular updates, ensure that the following root certificates are installed:
  - DigiCert Assured ID Root CA
  - DigiCert\_High\_Assurance\_EV\_Root\_CA
  - DigiCertAssuredIDRootCA

If the specified root certificates are not installed, the application may function improperly. We recommend that you install the certificates as soon as possible.

# File Integrity Monitor

By default, the File Integrity Monitor does not monitor changes in the system folders or the file system's housekeeping files to not clutter task reports with information about routine file changes performed constantly by the operating system. You cannot include such folders in the monitoring scope.

The following folders and files are excluded from the monitoring scope:

- NTFS housekeeping files with file id from 0 to 33
- %SystemRoot%\Prefetch\
- %SystemRoot%\ServiceProfiles\LocalService\AppData\Local\
- %SystemRoot%\System32\LogFiles\Scm\
- %SystemRoot%\Microsoft.NET\Framework\v4.0.30319\
- %SystemRoot%\Microsoft.NET\Framework64\v4.0.30319\
- %SystemRoot%\Microsoft.NET\
- %SystemRoot%\System32\config\
- %SystemRoot%\Temp\
- %SystemRoot%\ServiceProfiles\LocalService\
- %SystemRoot%\System32\winevt\Logs\
- %SystemRoot%\System32\wbem\repository\
- %SystemRoot%\System32\wbem\Logs\
- %ProgramData%\Microsoft\Windows\WER\ReportQueue\
- %SystemRoot%\SoftwareDistribution\DataStore\
- %SystemRoot%\SoftwareDistribution\DataStore\Logs\
- %ProgramData%\Microsoft\Windows\AppRepository\
- %ProgramData%\Microsoft\Search\Data\Applications\Windows\
- %SystemRoot%\Logs\SystemRestore\
- %SystemRoot%\System32\Tasks\Microsoft\Windows\TaskScheduler\

The application excludes top-level folders.

The component does not monitor files changes that bypass the ReFS/NTFS file system (file changes made through BIOS, LiveCD, and more).

# Firewall Management

Following is the list of limitations for Firewall Management:

- You should specify more than one address. Otherwise, working with IPv6 is unavailable.
- Preset Firewall policy rules support basic scenarios of interaction between protected devices and Administration Server. To make full use of Kaspersky Security Center functions, you need to configure port rules. You can find information about port numbers, protocols and their functions in the Kaspersky Security Center Knowledge Base.
- After you install the application and configure the rules for the task, the application controls the modification of Windows Firewall rules and rule groups when the Firewall management task is started. To update the status and add the required rules, make sure to restart the Firewall management task.
- When the Firewall Management task is started, denying rules and rules monitoring outgoing traffic are automatically removed from the operating system firewall settings.

## Other limitations

Limitations of **On-Demand Scan** and **Real-Time File Protection**:

- Scanning of connected MTP-devices is not available.
- Archive scanning is unavailable without SFX-archive scanning: if archive scanning is enabled in the protection settings of Kaspersky Embedded Systems Security, the application automatically scans objects in both archives and SFX-archives. SFX-archive scanning is available without archive scanning.
- If **Deeper analysis of launching processes (process launch is blocked until the analysis ends)** checkbox and **KSN Usage** service are enabled simultaneously, any launched process that receives URL web-address as an argument will be blocked, even if Only Statistics mode was chosen. To avoid blocking the process, please choose one of the options:
  - Disable **KSN Usage** service
  - Disable **Deeper analysis of launching processes (process launch is blocked until the analysis ends)** checkbox

Recommended option: Disable Deeper analysis of launching processes checkbox

### Licensing:

- You cannot activate the application with a key via the Setup wizard if the key was created using the SUBST command, or if the path to the key file is a network path.
- If you plan to use Kaspersky Security Center proxy server to activate the product on a client device, disable VDI optimization on this device when installing Kaspersky Security Center Network Agent.

### Updates:

- By default, the application icon is hidden after Kaspersky Embedded Systems Security critical modules updates are installed.
- KLRAMDISK is not supported on protected devices running the Windows XP or Windows Server® 2003 operating system.

#### **Interface:**

- In the Application Console, filtering in the Quarantine, Backup, System audit log or Task log is case sensitive.
- When configuring a protection or scan scope in the Application Console, you can use only one mask and only at the end of the path. Following are the examples of correct masks: "C:\Temp\Temp\*", or "C:\Temp\Temp???\*.doc", and "C:\Temp\Temp\*.doc". This limitation does not affect configuration of the Trusted Zone.

#### **Security:**

- If the operating system's User Account Control feature is enabled, a user account must be part of the KAVWSEE Administrators group to open the Application Console with a double-click on the application icon in the tray notification area. Otherwise, it will be necessary to login as a user who is allowed to open the Compact Diagnostic Interface or Microsoft Management Console snap-in.
- If User Account Control is enabled, you cannot uninstall the application via the Microsoft Windows Programs and Features window.

#### **Integration with Kaspersky Security Center:**

- When update packages are received, Administration Server verifies database updates before sending the updates to protected devices on the network. Administration Server does not verify software module updates.
- Make sure that the required check boxes are selected in the Interaction with the Administration Server settings when you use the components that transmit dynamic data to Kaspersky Security Center using network lists (Quarantine, Backup).

#### **Exploit prevention:**

- Exploit Prevention is unavailable if the apphelp.dll libraries are not loaded in the current environment configuration.
- The Exploit Prevention component is incompatible with Microsoft's EMET utility on protected devices running the Microsoft Windows 10 operating system: Kaspersky Embedded Systems Security blocks EMET, if the Exploit Prevention component is being installed on a protected device with EMET installed.
- Exploit Prevention component is incompatible with SQL Server® 2012 Database Engine. If you install Kaspersky Embedded Systems Security on the computer with installed MS SQL Server 2012, you must add the sqllos.dll library of the database server to the list of exclusions in the Exploit Prevention task.

## Installing and removing the application

This section provides step-by-step instructions for installing and removing Kaspersky Embedded Systems Security.

### Kaspersky Embedded Systems Security software component codes for the Windows Installer service

The `\product_long_term\ess_x86.msi` and `\product_long_term\ess_x64.msi` files are designed to install the [Protect computer with Default Deny technology](#) configuration of Kaspersky Embedded Systems Security, and the `\product\ess_x86.msi` and `\product\ess_x64.msi` files are designed to install the [Protect computer with Anti-Virus Bases](#) configuration of Kaspersky Embedded Systems Security.

If the Protect computer with Anti-Virus Bases configuration is selected, all Kaspersky Embedded Systems Security components are included by default except the Firewall Management and Performance Counters components.

When you install the Protect computer with Anti-Virus Bases configuration of Kaspersky Embedded Systems Security over the application version that does not use signature analysis and anti-virus databases to protect your computer, the set of application components will be automatically expanded by adding the following components:

- Real-Time File Protection
- On-Demand Scan
- Network Threat Protection

The components enabling updates are not included in the Protect computer with Default Deny technology configuration.

If the Protect computer with Default Deny technology configuration is selected, the following components are included by default:

- Core
- Exploit Prevention
- Application Launch Control
- System Tray Icon

When you install the Protect computer with Default Deny technology configuration of Kaspersky Embedded Systems Security over the application version that uses signature analysis and anti-virus databases to protect your computer, the set of application components will be automatically reduced by removing the following components:

- Real-Time File Protection
- On-Demand Scan
- the components enabling updates

This configuration is recommended for protecting systems with limited resources. In this case, you can activate the application for a long term, and the Applications Launch Control component provides computer protection.

The `\console\esstools_x86.msi` and `\console\esstools_x64.msi` files install all software components in the "Administration Tools" set.

The following sections list the Kaspersky Embedded Systems Security component codes for the Windows Installer service. You can use the component codes to define a list of components to be installed when installing Kaspersky Embedded Systems Security from the command line.

## Kaspersky Embedded Systems Security software components

The following table contains codes and descriptions of Kaspersky Embedded Systems Security software components.

Description of Kaspersky Embedded Systems Security software components

Component	Identifier	Functions performed
Basic functionality	Core	This component contains the set of basic application functions and ensures their operation.  If other Kaspersky Embedded Systems Security components are specified when installing Kaspersky Embedded Systems Security from the command line, but the Core component is not specified, the Core component is installed automatically.
Applications Launch Control	AppCtrl	This component monitors user attempts to start applications and allows or denies application launch in accordance with specified Applications Launch Control rules.

		It is implemented in the Applications Launch Control task.
Device Control	DevCtrl	<p>This component tracks attempts to connect external devices to a protected device and allows or denies use of these devices according to the specified device control rules.</p> <p>The component is implemented in the Device Control task.</p>
Anti-Virus protection	AVProtection	<p>This component provides anti-virus protection and contains the following components:</p> <ul style="list-style-type: none"> <li>• On-Demand Scan</li> <li>• Real-Time File Protection</li> <li>• Network Threat Protection</li> </ul>
Network Threat Protection	IDS	<p>This component scans inbound network traffic for activity that is typical of network attacks. Upon detecting an attempted network attack that targets your computer, Kaspersky Embedded Systems Security blocks network activity from the attacking computer.</p>
On-Demand Scan	Ods	<p>This component installs Kaspersky Embedded Systems Security system files and provides On-Demand scan tasks (scanning of objects on the protected device upon request).</p>
Real-Time File Protection	Oas	<p>This component performs virus scans of files on the protected device when these files are accessed.</p> <p>It implements the Real-Time File Protection task.</p>
Kaspersky Security Network Usage	Ksn	<p>This component provides protection based on Kaspersky cloud technologies.</p> <p>It implements the KSN Usage task (sending requests to and receiving conclusions from the Kaspersky Security Network service).</p>
File Integrity Monitor	Fim	<p>This component logs operations performed on files in the specified monitoring scope.</p> <p>The component implements the File Integrity Monitor task.</p>
Registry Access Monitor	RegMonitor	<p>This component makes it possible to monitor actions performed with the specified registry branches and keys in the monitoring scopes defined in the task settings.</p> <p>The component implements the Registry Access Monitor.</p>
Exploit Prevention	AntiExploit	<p>This component makes it possible to manage settings to protect memory used by processes in a device's memory.</p>
Firewall Management	Firewall	<p>This component makes it possible to manage Windows Firewall through the Kaspersky Embedded Systems Security graphical user interface.</p> <p>The component implements the Firewall Management task.</p>
Module for integration with Kaspersky Security Center Network Agent	AKIntegration	<p>This component provides a connection between the Kaspersky Embedded Systems Security and the Kaspersky Security Center Network Agent.</p> <p>You can install this component on the protected device if you intend to manage the application via the Kaspersky Security Center.</p>
Log	LogInspector	<p>This component monitors the integrity of the protected environment</p>

Inspection		based on the results of an inspection of Windows event logs.
Set of "System Monitor" performance counters	PerfMonCounters	This component installs a set of System Monitor performance counters. Performance counters enable Kaspersky Embedded Systems Security performance to be measured and potential bottlenecks to be located on the protected device when Kaspersky Embedded Systems Security is used with other programs.
SNMP counters and traps	SnmpSupport	This component publishes Kaspersky Embedded Systems Security counters and traps via Simple Network Management Protocol (SNMP) on Microsoft Windows. This component may be installed on the protected device only if Microsoft SNMP service is installed on the same protected device.
Kaspersky Embedded Systems Security icon in the notification area	TrayApp	This component displays the Kaspersky Embedded Systems Security icon in the task tray notification area of the protected device. The Kaspersky Embedded Systems Security icon displays the status of device protection and can be used to open the Kaspersky Embedded Systems Security Console in Microsoft Management Console (if installed) and the <b>About the application</b> window.

## "Administration tools" software component

The following table contains the code and the description of the "Administration tools" software component.

Description of the "Administration tools" software component

Component	Code	Component functions
Kaspersky Embedded Systems Security snap-in	MmcSnapin	<p>This component installs the Microsoft Management Console snap-in to manage the application via the Kaspersky Embedded Systems Security Console.</p> <p>If other components are specified during installation of "Administration Tools" from the command line, and the MmcSnapin component is not specified, the component will be installed automatically.</p>

## System changes after Kaspersky Embedded Systems Security installation

When Kaspersky Embedded Systems Security and the set of "Administration Tools" (including the Application Console) are installed together, the Windows Installer service will make the following modifications on the protected device:

- Kaspersky Embedded Systems Security folders are created on the protected device and on the protected device where the Application Console is installed.
- Kaspersky Embedded Systems Security services are registered.
- Kaspersky Embedded Systems Security user group is created.
- Kaspersky Embedded Systems Security keys are registered in the system registry.

These changes are described below.

## Kaspersky Embedded Systems Security folders on a protected device

When Kaspersky Embedded Systems Security is installed, the following folders are created on a protected device:

- Kaspersky Embedded Systems Security default installation folder containing the Kaspersky Embedded Systems Security executable files depend on the operating system bit set. Therefore, the default installation folders are as follows:
  - On the 32-bit version of Microsoft Windows: %ProgramFiles%\Kaspersky Lab\Kaspersky Embedded Systems Security
  - On the 64-bit version of Microsoft Windows: %ProgramFiles(x86)%\Kaspersky Lab\Kaspersky Embedded Systems Security
- Management Information Base (MIB) files containing a description of the counters and hooks published by Kaspersky Embedded Systems Security via the SNMP protocol:
  - %Kaspersky Embedded Systems Security%\mibs
- 64-bit versions of Kaspersky Embedded Systems Security executable files (this folder will be created only during installation of Kaspersky Embedded Systems Security on the 64-bit version of Microsoft Windows):
  - %Kaspersky Embedded Systems Security%\x64
- Kaspersky Embedded Systems Security service files:
  - %ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Data
  - %ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Settings
  - %ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Dskm

For Windows XP the path to the Kaspersky Lab folder is %ALLUSERSPROFILE%\Application Data

- Files with settings for update sources:
  - %ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Update
  - %ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Update
- Updates of databases and software modules downloaded using the Copying Updates task (the folder will be created the first time updates are downloaded using the Copying Updates task).
  - %ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Update\Distribution
- Task logs and system audit log.
  - %ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Reports
- Set of databases currently in use.
  - %ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Bases\Current
- Backup copies of databases; they are overwritten each time the databases are updated.
  - %ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Bases\Backup
- Temporary files created during execution of update tasks.

%ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Bases\Temp

- Quarantined objects (default folder).

%ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Quarantine

- Objects in backup (default folder).

%ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Backup

- Objects restored from backup and quarantine (default folder for restored objects).

%ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Restored

## Folder created during installation of Application Console

The Application Console default installation folders containing the "Administration Tools" files depend on the operating system bit set. Therefore, the default installation folders are as follows:

- On the 32-bit version of Microsoft Windows: %ProgramFiles%\Kaspersky Lab\Kaspersky Embedded Systems Security Admins Tools
- On the 64-bit version of Microsoft Windows: %ProgramFiles(x86)%\Kaspersky Lab\Kaspersky Embedded Systems Security Admins Tools

## Kaspersky Embedded Systems Security services

The following Kaspersky Embedded Systems Security services start using the local system (SYSTEM) account:

- Kaspersky Security Service (KAVFS) – essential Kaspersky Embedded Systems Security service that manages Kaspersky Embedded Systems Security tasks and workflows.
- Kaspersky Security Management Service (KAVFSGT) – this service is intended for Kaspersky Embedded Systems Security application management through the Application Console.
- Kaspersky Security Exploit Prevention Service (KAVFSSLP) – a service that acts as an intermediary to communicate security settings to external security agents, and to receive data about security events.

## Kaspersky Embedded Systems Security group

ESS Administrators is a group on the protected device, which users have full access to the Kaspersky Security Management Service and to all Kaspersky Embedded Systems Security functions.

## System registry keys

When Kaspersky Embedded Systems Security is installed, the following system registry keys are created:

- Properties of the Kaspersky Embedded Systems Security:  
[HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\KAVFS]
- Kaspersky Embedded Systems Security event log settings (Kaspersky Event Log):  
[HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\Eventlog\Kaspersky Security]

- Properties of the Kaspersky Embedded Systems Security management service:  
[HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\KAVFSGT]
- Performance counter settings:
  - On the 32-bit version of Microsoft Windows:  
[HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\Kaspersky Security\Performance]
  - On the 64-bit version of Microsoft Windows:  
[HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\Kaspersky Security x64\Performance]
- SNMP Protocol Support component settings:
  - On the 32-bit version of Microsoft Windows:  
[HKEY\_LOCAL\_MACHINE\SOFTWARE\KasperskyLab\ESS\3.2\SnmpAgent]
  - On the 64-bit version of Microsoft Windows:  
[HKEY\_LOCAL\_MACHINE\SOFTWARE\Wow6432Node\KasperskyLab\ESS\3.2\SnmpAgent]
- Dump file settings:
  - On the 32-bit version of Microsoft Windows:  
[HKEY\_LOCAL\_MACHINE\SOFTWARE\KasperskyLab\ESS\3.2\CrashDump]
  - On the 64-bit version of Microsoft Windows:  
[HKEY\_LOCAL\_MACHINE\SOFTWARE\Wow6432Node\KasperskyLab\ESS\3.2\CrashDump]
- Trace file settings:
  - On the 32-bit version of Microsoft Windows:  
[HKEY\_LOCAL\_MACHINE\SOFTWARE\KasperskyLab\ESS\3.2\Trace]
  - On the 64-bit version of Microsoft Windows:  
[HKEY\_LOCAL\_MACHINE\SOFTWARE\Wow6432Node\KasperskyLab\ESS\3.2\Trace]
- Configuration of the application's tasks and functions:  
[HKEY\_LOCAL\_MACHINE\SOFTWARE\Wow6432Node\KasperskyLab\ESS\3.2\Environment]

## Kaspersky Embedded Systems Security processes

Kaspersky Embedded Systems Security starts processes described in the table below.

Kaspersky Embedded Systems Security processes

File name	Purpose
kavfswp.exe	Kaspersky Embedded Systems Security workflow
kavtray.exe	Process for the System Tray Icon
kavfsmui.exe	Process for the Compact Diagnostic Interface component
kavshell.exe	Command line utility process
kavfsrcn.exe	Kaspersky Embedded Systems Security remote management process
kavfs.exe	Kaspersky Security Service process

kavfsgt.exe	Kaspersky Security Management Service process
kavfswh.exe	Kaspersky Security Exploit Prevention Service process

## Installation and uninstallation settings and command line options for the Windows Installer service

This section contains descriptions of the settings for installing and uninstalling Kaspersky Embedded Systems Security, their default values, keys for changing the installation settings, and their possible values. These keys can be used in conjunction with standard keys for the Windows Installer service's `msiexec` command when installing Kaspersky Embedded Systems Security from the command line.

### Installation settings and command line options in Windows Installer

- Acceptance of the terms of the End User License Agreement: you must accept the terms to install Kaspersky Embedded Systems Security.

The possible values for `EULA=<value>` command line option are as follows:

- 0 – you reject the terms of the End User License Agreement (default value).
- 1 – you accept the terms of the End User License Agreement.
- Acceptance of the terms of the Privacy Policy: you must accept the terms to install Kaspersky Embedded Systems Security.

The possible values for `PRIVACYPOLICY=<value>` command line option are as follows:

- 0 – you reject the terms of the Privacy Policy (default value).
- 1 – you accept the terms of the Privacy Policy.
- Allow installation of Kaspersky Embedded Systems Security if the KB4528760 update not installed. For detailed information about the KB4528760 update please visit [Microsoft website](#).

The possible values for `SKIPCVEWINDOWS10=<value>` command line option are as follows:

- 0 – cancel the installation of Kaspersky Embedded Systems Security if the KB4528760 update is not installed (default value).
- 1 – allow the installation of Kaspersky Embedded Systems Security if the KB4528760 update is not installed.

The KB4528760 update fixes the CVE-2020-0601 security vulnerability. For detailed information about the CVE-2020-0601 security vulnerability please visit the [Microsoft website](#).

- Installation of Kaspersky Embedded Systems Security with restored defined settings from the previous version during update.

The possible values for `RESTOREDEFSETTINGS=<value>` command line option are as follows:

- 0 – all data from the previous version is transferred to a new version during update (default value).
- 1 – only the file with activation data and private keys is transferred to a new version during update (`[drive]:\ProgramData\Kaspersky Lab\<product>\<version>\Data\product.dat`). All other data from the

previous version, such as settings, anti-virus databases, reports, quarantine and backup objects, is removed.

- Installation of Kaspersky Embedded Systems Security with reports preserved from the previous versions during update.

The possible values for KEEP\_REPORTS=<value> command line option are as follows:

- 0 – all data from the previous version is transferred to a new version during update, except for reports ([drive]:\ProgramData\Kaspersky Lab\<product>\<version>\Reports). Reports are removed.
  - 1 – all data from the previous version, such as settings, anti-virus databases, reports, quarantine and backup objects, is transferred to a new version during update (default value).
- Installation of Kaspersky Embedded Systems Security with a preliminary scan of active processes and the boot sectors of local disks.

The possible values for PRESCAN=<value> command line option are as follows:

- 0 – do not perform a preliminary scan of active processes and the boot sectors of local disks during the installation (default value).
  - 1 – perform a preliminary scan of active processes and the boot sectors of local disks during the installation.
- Destination folder where Kaspersky Embedded Systems Security files will be saved during installation. A different folder can be specified.

The default values for INSTALLDIR=<full path to the folder> command line option are as follows:

- Kaspersky Embedded Systems Security: %ProgramFiles%\Kaspersky Lab\Kaspersky Embedded Systems Security
  - Administration tools: %ProgramFiles%\Kaspersky Lab\Kaspersky Embedded Systems Security Admins Tools
  - On the x64-bit version of Microsoft Windows: %ProgramFiles(x86)%
- The Real-Time File Protection task starts immediately after Kaspersky Embedded Systems Security starts. Turn on this setting to start Real-Time File Protection when Kaspersky Embedded Systems Security starts (recommended).

The possible values for RUNRTP=<value> command line option are as follows:

- 1 – start (default value).
  - 0 – do not start.
- Objects excluded from the protection scope according to Microsoft Corporation recommendations. In the Real-Time File Protection task exclude from the protection scope objects on the device that Microsoft Corporation recommends to exclude. Some applications on the protected device may become unstable when an anti-virus application intercepts or modifies the files they use. For example, Microsoft Corporation includes some domain controller applications in the list of such objects.

The possible values for ADDMSEXCLUSION=<value> command line option are as follows:

- 1 – exclude (default value).
- 0 – do not exclude.

- Objects excluded from the protection scope according to Kaspersky recommendations. In the Real-Time File Protection task exclude from the protection scope objects on the device that Kaspersky recommends to exclude.

The possible values for ADDKLEXCLUSION=<value> command line option are as follows:

- 1 – exclude (default value).
  - 0 – do not exclude.
- Allow remote connection to the Application Console. By default, remote connection is not allowed to the Application Console installed on the protected device. During the installation, you can allow connection. Kaspersky Embedded Systems Security creates allowing rules for the process kavfsgt.exe using the TCP protocol for all ports.

The possible values for ALLOWREMOTECON=<value> command line option are as follows:

- 1 – allow.
  - 0 – deny (default value).
- Path to the key file ( LICENSEKEYPATH )

. By default, the Windows Installer attempts to find the file with .key extension in the \product folder of the distribution kit. If the \product folder contains several key files, the Windows Installer will select the key file that has the farthest expiration date. A key file can be saved beforehand in the \product folder or by specifying another path to the key file using the **Add key** setting. You can add a key after Kaspersky Embedded Systems Security is installed using an administrative tool of your choice: for example, the Application Console. If you do not add a key during installation of the application, Kaspersky Embedded Systems Security will not function.

- Path to the configuration file. Kaspersky Embedded Systems Security imports settings from the specified configuration file created in the application. Kaspersky Embedded Systems Security does not import passwords from the configuration file, for example, account passwords for starting tasks, or passwords for connecting to a proxy server. Once the settings are imported, you will have to enter all passwords manually. If the configuration file is not specified, the application will start to work with the default settings after setup.

The default value for CONFIGPATH=<configuration file name> is not specified.

- Mode of the **Scan at Operation System startup** task (SCANSTARTUP\_BLOCKING). If you install Kaspersky Embedded Systems Security in the install mode without the SCANSTARTUP\_BLOCKING key, the **Scan at Operation System startup** task has the following parameters assigned to the **Scan scope** setting:
  - **Action to perform on infected and other objects: Notify only**
  - **Action to perform on probably infected objects: Notify only**

If you install Kaspersky Embedded Systems Security in the install mode using the SCANSTARTUP\_BLOCKING key, the **Scan at Operation System startup** task has the following parameters assigned to the **Scan scope** setting:

- **Action to perform on infected and other objects: Perform recommended action**
- **Action to perform on probably infected objects: Perform recommended action**

The **Scan at Operation System startup** task is created automatically. By default, the **Notify only** mode is applied. In this case, after you deploy Kaspersky Embedded Systems Security on the devices, you can enable the **Scan at Operation System startup** task if no issues with system services were discovered during scan. If the application detects critical system services as infected or probably infected objects, the **Notify only** mode gives you time to figure out the reason and solve the issue. If the application applies the **Perform recommended action** mode, which calls the **Disinfect. Remove if disinfection fails** action, disinfection or removal of the system files may result in critical issues with the operating system startup.

- Enabling network connections for the Application Console option is used to install Kaspersky Embedded Systems Security Console on another device. You can remotely manage device protection from another device with the Kaspersky Embedded Systems Security Console installed. Port 135 (TCP) is opened in Microsoft Windows Firewall, network connections are allowed for the executable file kavfsrnc.exe for remote management of Kaspersky Embedded Systems Security, and access is granted to DCOM applications. When installation is complete, add users to the ESS Administrators group to let them remotely manage the application, and allow network connections to the Kaspersky Security Management Service (kavfsgr.exe file) on the protected device. You can read more about additional configuration when the [Kaspersky Embedded Systems Security Console is installed on another device](#).

The possible values for ADDWFEXCLUSION=<value> command line option are as follows:

- 1 – allow.
- 0 – deny (default value).
- Disabling the check for incompatible software. Use this setting to enable or disable the check for incompatible software during background installation of the application on the protected device. Regardless of the value of this setting, during installation of Kaspersky Embedded Systems Security, the application always warns about other versions of the application installed on the protected device.

The possible values for SKIPINCOMPATIBLESW=<value> command line option are as follows:

- 0 – The check for incompatible software is performed (default value).
- 1 – The check for incompatible software is not performed.

## Uninstallation settings and command line options in Windows Installer

- Restoring quarantined objects.

The possible values for RESTOREQTN=<value> command line option are as follows:

- 0 – Remove quarantined content (default value).
- 1 – Restore quarantined content to the folder specified by the RESTOREPATH parameter into the \Quarantine subfolder.
- Restoring the content of backup.

The possible values for RESTOREBCK=<value> command line option are as follows:

- 0 – Remove backup content (default value).
- 1 – Restore backup contents to the folder specified by the RESTOREPATH parameter into the \Backup subfolder.
- Enter the current password to confirm the uninstallation (if password protection is enabled).

The default value for UNLOCK\_PASSWORD=<specified password> is not specified.

- Folder for restored objects. Restored objects will be saved to the specified folder.

The default value for RESTOREPATH=<full path to the folder> command line option is %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Restored

## Kaspersky Embedded Systems Security install and uninstall logs

If Kaspersky Embedded Systems Security is installed or uninstalled using the Installation (Uninstallation) Wizard, the Windows Installer service creates an install (uninstall) log. A log file named ess\_v3.2\_install\_<uid>.log (where <uid> is a unique 8-character log identifier) will be saved in the %temp% folder for the user whose account was used to start the setup.exe file.

If you run the **Modify or Remove** option for the Application Console or Kaspersky Embedded Systems Security from the **Start** menu, a log file named ess\_3.2\_maintenance.log is automatically created in the %temp% folder.

If Kaspersky Embedded Systems Security is installed or uninstalled from the command line, the install log file will not be created by default.

*To install Kaspersky Embedded Systems Security and create a log file on disk C:\:*

- `msiexec /i ess_x86.msi /l*v C:\ess.log /qn EULA=1 PRIVACYPOLICY=1`
- `msiexec /i ess_x64.msi /l*v C:\ess.log /qn EULA=1 PRIVACYPOLICY=1`

## Installation planning

This section describes the set of Kaspersky Embedded Systems Security administration tools, and special aspects of installing and uninstalling Kaspersky Embedded Systems Security [using a wizard](#), [command line](#), [using Kaspersky Security Center](#) and [via an Active Directory group policy](#).

Before starting installation of Kaspersky Embedded Systems Security, plan the main stages of the installation.

1. Determine which administration tools will be used to manage and configure Kaspersky Embedded Systems Security.
2. Select the [necessary application components for installation](#).
3. Select the installation method.

## Selecting administration tools

Determine the administration tools that will be used to configure Kaspersky Embedded Systems Security settings and to manage the application. Kaspersky Embedded Systems Security can be managed using the Application Console, command-line utility, and Kaspersky Security Center Administration Console.

### Kaspersky Embedded Systems Security Console

Kaspersky Embedded Systems Security Console is a standalone snap-in added to the Microsoft Management Console. Kaspersky Embedded Systems Security can be managed via the Application Console installed on the protected device or on another device on the corporate network.

Multiple Kaspersky Embedded Systems Security snap-ins can be added to one Microsoft Management Console opened in author mode to use it to manage the protection of multiple device with Kaspersky Embedded Systems Security installed.

The Application Console is included in the set of "Administration Tools" application components.

## Command line utility

You can manage Kaspersky Embedded Systems Security from the command line of a protected device.

The command line utility is included in the Kaspersky Embedded Systems Security software components group.

## Kaspersky Security Center

If Kaspersky Security Center is used for centralized management of anti-virus protection of devices at your company, you can manage Kaspersky Embedded Systems Security via the Kaspersky Security Center Administration Console.

The following components must be installed:

- **Module for integration with Kaspersky Security Center Network Agent.** This component is included in the Kaspersky Embedded Systems Security software components group. It allows Kaspersky Embedded Systems Security to communicate with the Network Agent. Install the module for integration with Kaspersky Security Center Network Agent on the protected device.
- **Kaspersky Security Center Network Agent.** Install this component on each protected device. This component supports interaction between Kaspersky Embedded Systems Security installed on the protected device and Kaspersky Security Center Administration Console. The Network Agent installation file is included in the Kaspersky Security Center distribution kit folder.
- **Kaspersky Embedded Systems Security 3.2 Administration Plug-in.** Additionally, install the Administration Plug-in for managing Kaspersky Embedded Systems Security via the Administration Console on the protected device where the Kaspersky Security Center Administration Server is installed. This provides the interface for application management via Kaspersky Security Center. The Administration Plug-in installation file, `\product\klcfginst.exe`, is included in the Kaspersky Embedded Systems Security distribution kit.

## Selecting the installation type

After specifying the [software components for installation of Kaspersky Embedded Systems Security](#), you need to select the application installation method.

Select the installation method depending on the network architecture and the following conditions:

- Whether you need special Kaspersky Embedded Systems Security installation settings, or the recommended [installation settings](#).
- Whether the installation settings will be the same for all protected devices or specific to each protected device.

Kaspersky Embedded Systems Security can be installed interactively using the Setup Wizard or in silent mode without user involvement, and can be invoked by running the installation package file with installation settings from the command line. A centralized remote installation of Kaspersky Embedded Systems Security can be performed using Active Directory group policies or using the Kaspersky Security Center remote installation task.

Kaspersky Embedded Systems Security can be installed and configured on a single protected device with its settings saved to a configuration file; the file can then be used to install Kaspersky Embedded Systems Security on other protected devices. Note that this ability does not exist when the application is installed using Active Directory group policies.

## Starting the Setup Wizard

The Setup Wizard can install the following:

- [Kaspersky Embedded Systems Security components](#) on a protected device out of a \product\setup.exe file included in the distribution kit.
- [Kaspersky Embedded Systems Security Console](#) from the \console\setup.exe file in the distribution kit on the protected device or another LAN host.

## Running the installation package file from the command line with the necessary installation settings

If the installation package file is started without command-line options, Kaspersky Embedded Systems Security will be installed with the default settings. Kaspersky Embedded Systems Security options can be used to modify the installation settings.

The Application Console can be installed on the protected device and / or administrator's workstation.

You can also use [sample commands for the installation of Kaspersky Embedded Systems Security and the Application Console](#).

## Centralized installation via Kaspersky Security Center

If Kaspersky Security Center is used in your network for managing networked devices' anti-virus protection, Kaspersky Embedded Systems Security can be installed on multiple devices by using the remote installation task.

The protected devices on which you want to [install Kaspersky Embedded Systems Security using Kaspersky Security Center](#) may be in the same domain as Kaspersky Security Center in a different domain, or in no domain at all.

## Centralized installation using Active Directory group policies

Active Directory group policies can be used to install Kaspersky Embedded Systems Security on the protected device. The Application Console can be installed on the protected device or administrator's workstation.

Kaspersky Embedded Systems Security can be installed using just the recommended installation settings.

The protected devices on which [Kaspersky Embedded Systems Security is installed using Active Directory group policies](#) must be located in the same domain and the same organizational unit. Installation is performed at protected device start before logging in to Microsoft Windows.

## Installing and uninstalling the application using a wizard

This section describes the installation and uninstallation of Kaspersky Embedded Systems Security and the Application Console by means of the Setup Wizard, and contains information about additional configuration of Kaspersky Embedded Systems Security and actions to be performed upon installation.

### Installing using the Setup Wizard

The following sections contain information about installation of Kaspersky Embedded Systems Security and the Application Console.

*To install and proceed to use Kaspersky Embedded Systems Security:*

1. Install Kaspersky Embedded Systems Security on a protected device.
2. Install the Application Console on the devices from which you intend to manage Kaspersky Embedded Systems Security.
3. If the Application Console has been installed on any device in the network, other than protected device, perform the additional configuration to allow Application Console users to manage Kaspersky Embedded Systems Security remotely.
4. Perform actions after installation of Kaspersky Embedded Systems Security.

### Kaspersky Embedded Systems Security installation

Before installing Kaspersky Embedded Systems Security, do the following:

1. Make sure no other anti-virus programs are installed on the protected device.
2. Make sure that the account which you are using to start the Setup Wizard belongs to the administrators group on the protected device.

After completing the actions described above, proceed with the installation procedure. Following the Setup Wizard instructions, specify the installation settings for Kaspersky Embedded Systems Security. The Kaspersky Embedded Systems Security installation process can be stopped at any step of the Setup Wizard. To do so, click the **Cancel** button in the Setup Wizard's window.

You can read more about the [installation \(uninstallation\) settings](#).

*To install Kaspersky Embedded Systems Security using the Setup Wizard:*

1. Start the setup.exe file on the protected device.
2. In the window that opens, in the **Installation** section, click the [Protect computer with Default Deny technology](#)  or [Protect computer with Anti-Virus Bases](#)  link.

If the Protect computer with Anti-Virus Bases configuration is selected, all Kaspersky Embedded Systems Security components are included by default except the Firewall Management and Performance Counters components.

When you install the Protect computer with Anti-Virus Bases configuration of Kaspersky Embedded Systems Security over the application version that does not use signature analysis and anti-virus databases to protect your computer, the set of application components will be automatically expanded by adding the following components:

- Real-Time File Protection
- On-Demand Scan
- Network Threat Protection

The components enabling updates are not included in the Protect computer with Default Deny technology configuration.

If the Protect computer with Default Deny technology configuration is selected, the following components are included by default:

- Core
- Exploit Prevention
- Application Launch Control
- System Tray Icon

When you install the Protect computer with Default Deny technology configuration of Kaspersky Embedded Systems Security over the application version that uses signature analysis and anti-virus databases to protect your computer, the set of application components will be automatically reduced by removing the following components:

- Real-Time File Protection
- On-Demand Scan
- the components enabling updates

This configuration is recommended for protecting systems with limited resources. In this case, you can activate the application for a long term, and the Applications Launch Control component provides computer protection.

3. In the welcome screen of the Kaspersky Embedded Systems Security Setup Wizard, click the **Next** button.

The **End User License Agreement and Privacy Policy** window opens.

4. Review the terms of the License Agreement and Privacy Policy.

5. If you agree to the terms and conditions of End User License Agreement and Privacy Policy, select the **I confirm that I have fully read, understood, and accept the terms and conditions of this End User License Agreement and I am aware and agree that my data will be handled and transmitted (including to third countries) as described in the Privacy Policy. I confirm that I have fully read and understand the Privacy Policy** check boxes in order to proceed with the installation.

If you do not accept the End User License Agreement and/or Privacy Policy the installation will be aborted.

6. Click the **Next** button.

The **Custom installation** window opens.

7. Select the components to be installed.

The SNMP Protocol Support component of Kaspersky Embedded Systems Security will only appear in the list of components suggested for installation if the Microsoft Windows SNMP service is installed on the protected device.

8. To cancel all changes, click the **Reset** button in the **Custom installation** window. Click the **Next** button.

9. In the **Select a destination folder** window:

- If required, specify a folder to which Kaspersky Embedded Systems Security files will be copied.
- If required, review the information about available space on local drives by clicking the **Disk** button.

Click the **Next** button.

10. In the **Advanced installation settings** window, configure the following installation settings:

- **Enable real-time protection after installation of application.**
- **Add Microsoft recommended files to exclusions list.**
- **Add Kaspersky recommended files to exclusions list.**

Click the **Next** button.

11. In the **Import settings from configuration file** window:

- a. Specify the configuration file to import Kaspersky Embedded Systems Security settings from an existing configuration file created in any compatible previous version of the application.
- b. Click the **Next** button.

12. In the **Activation of the application** window, do one of the following:

- If you want to activate the application, specify a Kaspersky Embedded Systems Security key file for application activation.
- If you want to activate the application later, click the **Next** button.
- If a key file was previously saved in the \product folder of the distribution kit, the name of this file will be displayed in the **Key** field.

To add a key using a key file stored in another folder, specify the key file.

Once the key file is added, license information will be shown in the window. Kaspersky Embedded Systems Security displays the license's calculated expiration date. The license term runs from the time when you add a key and expires no later than the expiration date of the key file.

Click the **Next** button to apply the key file in the application.

13. In the **Ready to install** window, click the **Install** button. The wizard will start the installation of Kaspersky Embedded Systems Security components.
14. The **Installation complete** window opens when installation is complete.
15. Select the **View Release Notes** check box to view information about the release after the Setup Wizard is done.
16. Click **Finish**.

The Setup Wizard closes. Once installation is complete, Kaspersky Embedded Systems Security is ready to use if you have added an activation key.

## Kaspersky Embedded Systems Security Console installation

Follow the instructions of the Setup Wizard to configure installation settings for the Application Console. The installation process can be stopped at any step of the wizard. To do so, click the **Cancel** button in the Setup Wizard window.

*To install the Application Console:*

1. Make sure that the account you use to run the Setup Wizard belongs to the administrators group on the device.
2. Run the setup.exe file on the protected device.  
The welcome window opens.
3. Click on the **Install Kaspersky Embedded Systems Security Console** link.  
The Setup Wizard's welcome window opens.
4. Click the **Next** button.
5. In the window that opens, review the terms of the End User License Agreement and Privacy Policy, and select the check boxes under the **I confirm that I have fully read, understood, and accept the terms and conditions of this End User License Agreement** caption in order to proceed with the installation.
6. Click the **Next** button.  
The **Advanced installation settings** window opens.
7. In the **Advanced installation settings** window:
  - If you intend to use the Application Console to manage Kaspersky Embedded Systems Security installed on a remote device, select the **Allow remote access** check box.
  - To open the **Custom installation** window and select components:
    - a. Click the **Advanced** button.  
The **Custom installation** window opens.

- b. Select the "Administration Tools" components from the list.  
By default, all the components are installed.
- c. Click the **Next** button.

You can find more detailed information about [Kaspersky Embedded Systems Security components](#).

8. In the **Select a destination folder** window:

- a. If required, specify a different folder to which the files being installed should be saved.
- b. Click the **Next** button.

9. In the **Ready to install** window, click the **Install** button.

The wizard will begin installing the selected components.

10. Click **Finish**.

The Setup Wizard closes. The Application Console will be installed on the protected device.

If the "Administration tools" set has been installed on any device in the network other than protected device, configure the [advanced settings](#).

## Advanced settings after installation of the Application Console on another device

If the Application Console has been installed on any device in the network, other than a protected device, perform the following actions to allow users to manage Kaspersky Embedded Systems Security remotely:

- Add Kaspersky Embedded Systems Security users to the ESS Administrators group on the protected device.
- Allow network connections for the [Kaspersky Security Management Service \(kavfsgt.exe\)](#), if the protected device uses Windows Firewall or a third-party firewall.
- If the **Allow remote access** check box is not selected during installation of the Application Console on a device running Microsoft Windows, manually allow network connections for the Application Console via the device's firewall.

The Application Console on the remote device uses the DCOM protocol to receive information about Kaspersky Embedded Systems Security events (such as objects scanned, tasks completed, etc.) from the Kaspersky Security Management Service on the protected device. You need to allow network connections for the Application Console in the Windows Firewall settings in order to establish connections between the Application Console and the Kaspersky Security Management Service.

On the remote device, where the Application Console is installed, do the following:

- Make sure that anonymous remote access to COM applications is allowed (but not remote start and activation of COM applications).
- In Windows Firewall, open TCP port 135 and allow network connections for kavfsrcn.exe, the executable file of the Kaspersky Embedded Systems Security remote management process.

The device where the Application Console is installed uses TCP port 135 to access the protected device and to receive a response.

- Configure an outbound rule for Windows Firewall to allow the connection.

Unlike the traditional TCP/IP and UDP/IP services where a single protocol has a fixed port, DCOM dynamically assigns ports to remote COM objects. If a firewall exists between the client (where the Application Console is installed) and the DCOM endpoint (the protected device), a large range of ports must be opened.

The same steps should be applied to configure any other software or hardware firewall.

*If the Application Console is open while you configure the connection between the protected device and the device on which the Application Console is installed:*

1. Close the Application Console.
2. Wait until the Kaspersky Embedded Systems Security remote management process kavfsrcn.exe is finished.
3. Restart the Application Console.  
The new connection settings will be applied.

## Allowing anonymous remote access to COM applications

The names of settings may vary depending on the installed Windows operating system.

*To allow anonymous remote access to COM applications:*

1. On the remote device with the Kaspersky Embedded Systems Security Console installed, open the Component Services console.
2. Select **Start** → **Run**.
3. Enter the command dcomcnfg.
4. Click **OK**.
5. Expand the **Computers** node in the **Component Services** console on your protected device.
6. Open the context menu on the **My Computer** node.
7. Select **Properties**.
8. On the **COM Security** tab of the **Properties** window, click the **Edit Limits** button in the **Access permissions** settings group.
9. Make sure that the **Allow Remote Access** check box is selected for the ANONYMOUS LOGON user in the **Allow Remote Access** window.
10. Click **OK**.

## Allowing network connections for the Kaspersky Embedded Systems Security remote management process

The names of settings may vary depending on the installed Windows operating system.

*To open TCP port 135 in Windows Firewall and to allow network connections for the Kaspersky Embedded Systems Security remote management process:*

1. Close the Kaspersky Embedded Systems Security Console on the remote device.
2. Perform one of the following steps:
  - On Microsoft Windows XP SP2 or later:
    - a. Select **Start > Windows Firewall**.
    - b. In the **Windows Firewall** window (or Windows Firewall settings), click the **Add port** button on the **Exclusions** tab.
    - c. In the **Name** field, specify the port name RPC (TCP/135) or enter another name, for example Kaspersky Embedded Systems Security DCOM, and specify the port number (135) in the **Port name** field.
    - d. Select the **TCP** protocol.
    - e. Click **OK**.
    - f. Click the **Add** button on the **Exclusions** tab.
  - On Microsoft Windows 7 or later:
    - a. Select **Start > Control Panel > Windows Firewall**.
    - b. In the **Windows Firewall** window, select **Allow a program or feature through Windows Firewall**.
    - c. In the **Allow programs to communicate through Windows Firewall** window click the **Allow another program** button.
3. Specify the kavfsrnc.exe file in the **Add Program** window. It is located in the destination folder specified during installation of Kaspersky Embedded Systems Security Console using Microsoft Management Console.
4. Click **OK**.
5. Click the **OK** button in the **Windows Firewall (Windows Firewall settings)** window.

## Adding outbound rule for Windows Firewall

The names of settings may vary depending on the installed Windows operating system.

To add the outbound rule for Windows Firewall:

1. Select **Start > Control Panel > Windows Firewall**.
2. In the **Windows Firewall** window, click the **Advanced settings** link.  
The **Windows Firewall with Advanced Security** window opens.
3. Select the **Outbound Rules** child node.
4. Click on the **New Rule** option in the **Actions** pane.
5. In the **New Outbound Rule Wizard** window that opens, select the **Port** option and click **Next**.
6. Select the **TCP** protocol.
7. In the **Specific remote ports** field specify the following ports range for allowing outgoing connections: 1024-65535.
8. In the **Action** window, select the **Allow the connection** option.
9. Save the new rule and close the **Windows Firewall with Advanced Security** window.

The Windows Firewall will now allow network connections between the Application Console and Kaspersky Security Management Service.

## Actions to perform after Kaspersky Embedded Systems Security installation

Kaspersky Embedded Systems Security starts protection and scan tasks immediately after installation if you have activated the application. If **Enable real-time protection after installation of application** (default option) is selected during installation of Kaspersky Embedded Systems Security, the application scans the device's file system objects when they are accessed. Kaspersky Embedded Systems Security will run the Critical Areas Scan task every Friday at 8:00 PM.

We recommend taking the following steps after installing Kaspersky Embedded Systems Security:

- Start the application database update task. After installation Kaspersky Embedded Systems Security will scan objects using the database included in the application distribution kit.

We recommend updating Kaspersky Embedded Systems Security databases immediately since they may be out of date.

The application will then update the databases every hour according to the default schedule configured in the task.

- Run a Critical Areas Scan on the device if no anti-virus software with real-time file protection was installed on the device before installation of Kaspersky Embedded Systems Security.
- Configure administrator notifications about Kaspersky Embedded Systems Security events.

## Starting and configuring Kaspersky Embedded Systems Security Database Update task

*To update the application database after installation:*

1. In the Database Update task settings, configure a connection to an update source – Kaspersky HTTP or FTP update servers.
2. Start the Database Update task.

Web Proxy Auto-Discovery Protocol (WPAD) may not be configured on your network to detect proxy server settings automatically in the LAN. At that, your network may require authentication when accessing the proxy server.

*To specify the optional proxy server settings and authentication settings for accessing the proxy server:*

1. Open the context menu of the **Kaspersky Embedded Systems Security** node.
2. Select the **Properties** item.  
The **Application settings** window opens.
3. Select the **Connection settings** tab.
4. In the **Proxy server settings** section, select the **Use the specified proxy server** check box.
5. Enter the proxy server address in the **Address** field, and enter the port number for the proxy server in the **Port** field.
6. In the **Proxy server authentication settings** section, select the necessary authentication method in the drop-down list:
  - **Use NTLM authentication**, if the proxy server supports the built-in Microsoft Windows NTLM authentication. Kaspersky Embedded Systems Security will use the user account specified in the task settings to access the proxy server (by default the task will run under the **local system (SYSTEM)** user account).
  - **Use NTLM authentication with user name and password**, if the proxy server supports the built-in Microsoft Windows NTLM authentication. Kaspersky Embedded Systems Security will use the specified account to access the proxy server. Enter a user name and password or select a user from the list.
  - **Apply user name and password**, to select basic authentication. Enter a user name and password or select a user from the list.
7. Click **OK** in the **Application settings** window.

*To configure the connection to Kaspersky's update servers, in the Database Update task:*

1. Start Application Console in one of the following ways:
  - Open the Application Console on the protected device. To do this, select **Start > All Programs > Kaspersky Embedded Systems Security > Administration Tools > Kaspersky Embedded Systems Security 3.2 Console**.

- If the Application Console has been started on a device other than the protected one, connect to the device:
  - a. Open the context menu of the **Kaspersky Embedded Systems Security** node in the Application Console tree.
  - b. Select the **Connect to another computer** item.
  - c. In the **Select protected device** window, select **Another device** and in the text field indicate the network name of the protected device.

If the account you used to sign in to Microsoft Windows does not have [access permissions for the Kaspersky Security Management Service](#), indicate an account with the required permissions.

The Application Console window opens.

2. In the Application Console tree, expand the **Update** node.
3. Select the **Database Update** child node.
4. Click the **Properties** link in the results pane.
5. In the **Task settings** window that opens, open the **Connection settings** tab.
6. Select **Use proxy server settings to connect to Kaspersky update servers**.
7. Click **OK** in the **Task settings** window.

The settings for connecting to the update source in the Database Update task will be saved.

*To run the Database Update task:*

1. In the Application Console tree, expand the **Update** node.
2. In the context menu on the **Database Update** child node, select the **Start** item.

The Database Update task starts.

After the task has successfully completed, you can view the release date of the latest database updates installed in the results pane of the **Kaspersky Embedded Systems Security** node.

## Critical Areas Scan

After you have updated the Kaspersky Embedded Systems Security databases, scan the protected device for malware using the Critical Areas Scan task.

*To run the Critical Areas Scan task:*

1. Expand the **On-Demand Scan** node in the Application Console tree.
2. In the context menu of the **Critical Areas Scan** child node, select the **Start** command.

The task starts; the **Running** task status is displayed in the results pane.

To view the task log,

in the results pane of the **Critical Areas Scan** node, click the **Open task log** link.

## Modifying the set of components and repairing Kaspersky Embedded Systems Security

Kaspersky Embedded Systems Security components can be added or removed. You need to stop the Real-Time File Protection task before you can remove the Real-Time File Protection component. In other circumstances there is no need to stop the Real-Time File Protection task or Kaspersky Security Service.

If application management is password protected, Kaspersky Embedded Systems Security requests the password when you attempt to remove components or modify the set of components in the Setup Wizard.

To modify the set of Kaspersky Embedded Systems Security components:

1. In the **Start** menu, select **All programs > Kaspersky Embedded Systems Security > Modify or Remove Kaspersky Embedded Systems Security**.

The Setup Wizard's **Repair or remove installation** window opens.

2. Select **Modify components set**. Click the **Next** button.

The **Custom installation** window opens.

3. In the **Custom installation** window, in the list of available components, select the components that you want to add or remove from Kaspersky Embedded Systems Security. To do this, perform the following actions:

- To change the set of components, click the button next to the name of the selected component. Then in the context menu, select:
  - **Component will be installed on local hard drive**, if you want to install one component;
  - **Component and its subcomponents will be installed on local hard drive**, if you want to install a group of components.
- To remove previously installed components, click the button next to the name of the selected component. Then in the context menu, select **Component will be unavailable**.

Click the **Next** button.

4. In the **Ready to install** window, confirm the change to the set of software components by clicking the **Install** button.

5. In the window that opens when installation is complete, click the **OK** button.

The set of Kaspersky Embedded Systems Security components will be modified based on the specified settings.

If problems occur during the operation of Kaspersky Embedded Systems Security (Kaspersky Embedded Systems Security crashes; tasks crash or do not start), you can perform a repair for Kaspersky Embedded Systems Security. You can perform a repair while saving the current Kaspersky Embedded Systems Security settings, or you can select an option to reset all Kaspersky Embedded Systems Security settings to their default values.

To repair Kaspersky Embedded Systems Security after the application or a task crashes:

1. In the **Start** menu, select **All programs**.
2. Select **Kaspersky Embedded Systems Security**.
3. Select **Modify or Remove Kaspersky Embedded Systems Security**.  
The Setup Wizard's **Repair or remove installation** window opens.
4. Select **Repair installed components**. Click the **Next** button.  
This opens the **Repair installed components** window.
5. In the **Repair installed components** window, select the **Restore recommended application settings** check box if you want to reset the application settings and restore Kaspersky Embedded Systems Security with its default settings. Click the **Next** button.
6. In the **Ready to repair** window, confirm the repair operation by clicking the **Install** button.
7. In the window that opens when the repair operation is complete, click the **OK** button.

Kaspersky Embedded Systems Security will be repaired using the specified settings.

## Uninstalling using the Setup Wizard

This section contains instructions on removing Kaspersky Embedded Systems Security and the Application Console from a protected device using the Setup / Uninstallation Wizard.

## Kaspersky Embedded Systems Security uninstallation

Dump and trace files are not deleted on uninstalling Kaspersky Embedded Systems Security. You can manually delete dump and trace files from the folder specified during the [configuration of dump and trace files writing](#).

The names of settings may vary under different Windows operating systems.

Kaspersky Embedded Systems Security can be uninstalled from the protected device using the Setup / Uninstallation Wizard.

After uninstalling Kaspersky Embedded Systems Security from a protected device a restart may be required. The restart can be postponed.

Uninstallation, repair and installation of the application is not available via the Windows Control Panel if the operating system uses the UAC feature (User Account Control) or access to the application is password protected.

If application management is password protected, Kaspersky Embedded Systems Security requests the password when you attempt to remove components or modify the set of components in the Setup Wizard.

*To uninstall Kaspersky Embedded Systems Security:*

1. In the **Start** menu, select **All programs**.
2. Select **Kaspersky Embedded Systems Security**.
3. Select **Modify or Remove Kaspersky Embedded Systems Security**.  
The Setup Wizard's **Repair or remove installation** window opens.
4. Select **Remove software components**. Click the **Next** button.  
The **Advanced application uninstallation settings** window opens.
5. If necessary, in the **Advanced application uninstallation settings** window:
  - a. Select the **Export quarantine objects** check box to make Kaspersky Embedded Systems Security export objects that have been quarantined. The check box is cleared by default.
  - b. Check the **Export Backup objects** check box to export objects from Kaspersky Embedded Systems Security Backup. The check box is cleared by default.
  - c. Click the **Save to** button and select the folder to which you want to export the objects. By default, the objects will be exported to %ProgramData%\Kaspersky Lab\Kaspersky Embedded Systems Security\Uninstall.  
Click the **Next** button.
6. In the **Ready to uninstall** window, confirm the uninstallation by clicking the **Uninstall** button.
7. In the window that opens when the uninstallation is complete, click the **OK** button.  
  
Kaspersky Embedded Systems Security will be uninstalled from the protected device.

## Kaspersky Embedded Systems Security Console uninstallation

The names of settings may vary under different Windows operating systems.

You can uninstall the Application Console from the protected device using the Setup / Uninstallation Wizard.

After uninstalling the Application Console, you do not need to restart the protected device.

*To uninstall the Application Console:*

1. In the **Start** menu, select **All programs**.
2. Select **Kaspersky Embedded Systems Security**.
3. Select **Modify or Remove Kaspersky Embedded Systems Security**.  
The wizard's **Repair or remove installation** window opens.

4. Select **Remove software components** and click the **Next** button.
5. The **Ready to uninstall** window opens. Click the **Uninstall** button.  
The **Uninstallation complete** window opens.
6. Click **OK**.

Uninstallation is now complete, and the Setup Wizard closes.

## Installing and uninstalling the application from the command line

This section describes the particulars of installing and uninstalling Kaspersky Embedded Systems Security from the command line and contains examples of commands to install and uninstall Kaspersky Embedded Systems Security from the command line, and examples of commands to add and remove Kaspersky Embedded Systems Security components from the command line.

## About installing and uninstalling Kaspersky Embedded Systems Security from command line

Dump and trace files are not deleted on uninstalling Kaspersky Embedded Systems Security. You can manually delete dump and trace files from the folder specified during the [configuration of dump and trace files writing](#).

You can install or uninstall Kaspersky Embedded Systems Security and add or remove its components by running the `\product\ess_x86.msi` or `\product\ess_x64.msi` installation package file from the command line after you specify the installation settings using keys.

The "Administration Tools" set can be installed on the protected device or on another device on the network to work with the Application Console locally or remotely. To do this, use the `\console\esstools.msi` installation package.

Perform the installation using an account included in the administrators group on the protected device where the application is installed.

If one of the `\product\ess_x86.msi` or `\product\ess_x64.msi` files is run on the protected device without additional keys, Kaspersky Embedded Systems Security will be installed with the recommended installation settings.

You can assign the set of components to be installed using the `ADDLOCAL` command-line option and listing the codes for the selected components or sets of components.

## Example commands for installing Kaspersky Embedded Systems Security

This section provides examples of commands used to install Kaspersky Embedded Systems Security.

On protected devices running a 32-bit version of Microsoft Windows, run the files with the x86 suffix in the distribution kit. On protected devices running a 64-bit version of Microsoft Windows, run the files with the x64 suffix in the distribution kit.

Detailed information about the use of Windows Installer's standard commands and command-line options is provided in the documentation supplied by Microsoft.

## Examples of installing Kaspersky Embedded Systems Security from the setup.exe file

*To install Kaspersky Embedded Systems Security with the recommended installation settings without user involvement, run the following command:*

```
\product\setup.exe /s /p EULA=1 /p PRIVACYPOLICY=1
```

You can install Kaspersky Embedded Systems Security with the following settings:

- Only install the Real-Time File Protection and On-Demand Scan components
- Do not run Real-Time File Protection when starting Kaspersky Embedded Systems Security
- Do not exclude files that Microsoft Corporation recommends to exclude from the scan scope

*To install the components, such as Device Control, run the following command:*

```
\product\setup.exe /p ADDLOCAL=DevCtr1 /p RUNRTP=0 /p ADDMSEXCLUSION=0
```

You can use the following optional keys with this command when you install Kaspersky Embedded Systems Security on the computers with network devices and SCSI-devices that cause system failure after <RPRODUCT\_NAME\_NOM\_FULL> is installed:

```
/p SKIP_NETWORK_UPPERFILTERS=<1|0>
```

Enables (1) or disables (0) interception of network adapters connections.

```
/p SKIP_SCSIADAPTER_UPPERFILTERS=<1|0>
```

Enables (1) or disables (0) interception of SCSI-adapters connections.

## List of commands used for installation: running an .msi file

*To install Kaspersky Embedded Systems Security with the recommended installation settings without user involvement, run the following command:*

```
msiexec /i ess.msi /qn EULA=1 PRIVACYPOLICY=1
```

*To install Kaspersky Embedded Systems Security with the recommended installation settings and display the installation interface, run the following command:*

```
msiexec /i ess.msi /qn EULA=1 PRIVACYPOLICY=1
```

*To install Kaspersky Embedded Systems Security with the recommended installation settings, and to enable trace files rotation after the defined maximum of trace files is reached, run the following command:*

```
msiexec /i ess.msi TRACE_FOLDER=C:\Traces TRACE_MAX_ROLL_COUNT=50 /qn EULA=1  
PRIVACYPOLICY=1
```

Note that the TRACE\_FOLDER parameter is mandatory.

For the TRACE\_MAX\_ROLL\_COUNT parameter, the following conditions are introduced:

- If the parameter is specified, the trace files rotation is enabled with the maximum number of trace files that you define. Available range of values: from 1 to 999.
- If the parameter is specified with 0 as a value for maximum number of trace files, the trace files rotation is disabled.
- If the parameter is specified, and the value for maximum number of trace files is invalid or exceeds the allowed range of 1-999 files, the trace files rotation is enabled with the default value of 5 as the maximum number of trace files.
- If the parameter is not specified:
  - If the trace files rotation is already configured on the device, the settings remain unchanged. Parameters that you input will be ignored by the application.
  - If the trace files rotation is not yet configured on the device, the rotation option is enabled with the default value of 5 as the maximum number of trace files.

*To install and activate Kaspersky Embedded Systems Security using the key file C:\0000000A.key:*

```
msiexec /i ess.msi LICENSEKEYPATH=C:\0000000A.key /qn EULA=1 PRIVACYPOLICY=1
```

*To install Kaspersky Embedded Systems Security with a preliminary scan of active processes and the boot sectors of local disks, run the following command:*

```
msiexec /i ess.msi PRESCAN=1 /qn EULA=1 PRIVACYPOLICY=1
```

*To install Kaspersky Embedded Systems Security in the installation folder C:\ESS, run the following command:*

```
msiexec /i ess.msi INSTALLDIR=C:\ESS /qn EULA=1 PRIVACYPOLICY=1
```

*To install Kaspersky Embedded Systems Security and save an installation log file named ess.log in the folder where the Kaspersky Embedded Systems Security msi file is stored, run the following command:*

```
msiexec /i ess.msi /l*v ess.log /qn EULA=1 PRIVACYPOLICY=1
```

*To install Kaspersky Embedded Systems Security Console, run the following command:*

```
msiexec /i esstools.msi /qn EULA=1
```

*To install and activate Kaspersky Embedded Systems Security using the key file C:\0000000A.key and configure Kaspersky Embedded Systems Security according to the settings in the configuration file C:\settings.xml, run the following command:*

```
msiexec /i ess.msi LICENSEKEYPATH=C:\0000000A.key CONFIGPATH=C:\settings.xml /qn EULA=1  
PRIVACYPOLICY=1
```

*To install an application patch when Kaspersky Embedded Systems Security is password-protected, run the following command:*

```
msiexec /p "<msp file name with path>" UNLOCK_PASSWORD=<password>
```

## Actions to perform after Kaspersky Embedded Systems Security installation

Kaspersky Embedded Systems Security starts protection and scan tasks immediately after installation if you have activated the application. If you select the **Enable real-time protection after installation of application** option during installation of Kaspersky Embedded Systems Security, the application scans the device's file system objects when they are accessed. Kaspersky Embedded Systems Security will run the Critical Areas Scan task every Friday at 8:00 P.M.

We recommend that you take the following steps after installing Kaspersky Embedded Systems Security:

- Start the Kaspersky Embedded Systems Security Database Update task. After installation Kaspersky Embedded Systems Security will scan objects using the database included in its distribution kit. We recommend that you update the Kaspersky Embedded Systems Security database immediately. To do so, you must run the Database Update task. The database will then be updated every hour according to the default schedule.

For example, you can start the Database Update task by running the following command:

```
KAVSHELL UPDATE /KL /PROXY:proxy.company.com:8080 /AUTHTYPE:1 /PROXYUSER:inetuser /PROXYPWD:123456
```

In this case, Kaspersky Embedded Systems Security database updates are downloaded from Kaspersky update servers. Connection to an update source is established via a proxy server (proxy server address: proxy.company.com, port: 8080) using built-in Windows NTLM authentication to access the server under an account (user name: inetuser; password: 123456).

- Run a Critical Areas Scan of the device if no anti-virus software with real-time file protection was installed on the device before installation of Kaspersky Embedded Systems Security.

*To start the Critical Areas Scan task using the command line:*

```
KAVSHELL SCANCritical /W:scancritical.log
```

This command saves the task log in a file named scancritical.log contained in the current folder.

- Configure administrator notifications about Kaspersky Embedded Systems Security events.

## Adding and removing components. Sample commands

*The Applications Launch Control component is installed automatically.*

*To install the On-Demand Scan component, run the following command:*

```
msiexec /i ess.msi ADDLOCAL=0as,0ds /qn
```

or

```
\product\setup.exe /s /p ADDLOCAL=0as,0ds
```

After you add the components to the list, Kaspersky Embedded Systems Security reinstalls the existing components and installs the specified components.

To remove the installed components, run the following command:

```
msiexec /i ess.msi REMOVE=Firewall,PerfMonCounters EULA=1 PRIVACYPOLICY=1 /qn
```

To install new components, run the following command:

```
msiexec /i ess.msi  
ADDLOCAL=AKIntegration,AVProtection,AntiExploit,AppCtrl,DevCtrl,Fim,Ksn,LogInspector,Oas  
EULA=1 PRIVACYPOLICY=1 /qn
```

After you list the components that you want to install and remove, Kaspersky Embedded Systems Security installs and removes the components accordingly.

## Kaspersky Embedded Systems Security uninstallation. Sample commands

To uninstall Kaspersky Embedded Systems Security from the protected device, run the following command:

```
msiexec /x ess.msi /qn
```

or

- For 32-bit operating systems:  

```
msiexec /x {2CE8D225-8F60-49C9-82E3-C143D10D3CD4} /qn
```
- For 64-bit operating systems:  

```
msiexec /x {86D803C7-215D-4B46-A726-ED5AF57FC05D} /qn
```

To uninstall Kaspersky Embedded Systems Security Console, run the following command:

```
msiexec /x esstools.msi /qn
```

or

```
msiexec /x {71FB9E57-9F23-4D72-B762-E0314EF3C814} /qn
```

To uninstall Kaspersky Embedded Systems Security from a device on which password protection is enabled, perform the following command:

- For 32-bit operating systems:  

```
msiexec /x {2CE8D225-8F60-49C9-82E3-C143D10D3CD4} UNLOCK_PASSWORD=*** /qn
```
- For 64-bit operating systems:  

```
msiexec /x {86D803C7-215D-4B46-A726-ED5AF57FC05D} UNLOCK_PASSWORD=*** /qn
```

## Return codes

The table below contains a list of command-line return codes.

Code	Description
1324	The destination folder name contains invalid characters.
25001	Insufficient rights to install Kaspersky Embedded Systems Security. To install the application, start the installation wizard with local administrator rights.
25003	Kaspersky Embedded Systems Security cannot be installed on devices running this version of Microsoft Windows. Please start the installation wizard for 64-bit versions of Microsoft Windows.
25004	Incompatible software detected. To continue the installation, uninstall the following software: <list of incompatible software>.
25010	The indicated path cannot be used to save quarantined objects.
25011	The name of the folder for saving quarantined objects contains invalid characters.
26251	Unable to download the Performance Counters DLL.
26252	Unable to download the Performance Counters DLL.
27300	The driver cannot be installed.
27301	The driver cannot be uninstalled.
27302	The network component cannot be installed. Maximum supported number of filtered devices reached.
27303	Anti-virus databases not found.

## Installing and uninstalling the application using Kaspersky Security Center

This section contains general information about installing Kaspersky Embedded Systems Security via Kaspersky Security Center. It also describes how to install and uninstall Kaspersky Embedded Systems Security via Kaspersky Security Center and actions to perform after installing Kaspersky Embedded Systems Security.

### General information about installing via Kaspersky Security Center

You can install Kaspersky Embedded Systems Security via Kaspersky Security Center using the remote installation task.

After the remote installation task is complete, Kaspersky Embedded Systems Security will be installed with identical settings on multiple protected devices.

All protected devices can be combined in a single administration group, and a group task can be created to install Kaspersky Embedded Systems Security on the protected devices in this group.

You can create a task to remotely install Kaspersky Embedded Systems Security on a set of protected devices that are not in the same administration group. When creating this task, you must generate the list of individual protected devices that Kaspersky Embedded Systems Security should be installed on.

Detailed information on the remote installation task is provided in *Kaspersky Security Center Help*.

### Rights to install or uninstall Kaspersky Embedded Systems Security

The account specified in the remote installation (removal) task must be included in the administrators group on each of the protected devices in all cases except those described below:

- If the Kaspersky Security Center Network Agent is already installed on the protected devices on which Kaspersky Embedded Systems Security is to be installed (regardless of which domain the protected devices are in or whether they belong to any domain).

If the Network Agent is not yet installed on the protected devices, you can install it with Kaspersky Embedded Systems Security using a remote installation task. Before installing the Network Agent, make sure that the account you want to specify in the task is included in the administrators group on each of the protected devices.

- All protected devices on which you want to install Kaspersky Embedded Systems Security are in the same domain as the Administration Server, and the Administration Server is registered as the **Domain Admin** account (if this account has local administrator's rights on the protected devices within the domain).

By default, when using the **Forced installation** method, the remote installation task is run from the account running the Administration Server.

When working with group tasks or with tasks for sets of protected devices under forced installation (uninstallation) mode, an account must have the following rights on the protected device:

- Right to execute applications remotely.
- Rights to the **Admin\$** share.
- Right to **Log on as a service**.

## Installing Kaspersky Embedded Systems Security via Kaspersky Security Center

Detailed information about generating an installation package and creating a remote installation task is provided in the Kaspersky Security Center Implementation Guide.

If you intend to manage Kaspersky Embedded Systems Security via Kaspersky Security Center in the future, make sure that the following conditions are met:

- The protected device where the Kaspersky Security Center Administration Server is installed also has the Administration Plug-in installed (\product\klcfginst.exe file in the Kaspersky Embedded Systems Security distribution kit).
- Kaspersky Security Center Network Agent is installed on protected devices. If Kaspersky Security Center Network Agent is not installed on protected devices, you can install it together with Kaspersky Embedded Systems Security using a remote installation task.

Devices can also be combined into an administration group in order to later manage the protection settings using Kaspersky Security Center policies and group tasks.

*To install Kaspersky Embedded Systems Security using a remote installation task:*

1. Start the Kaspersky Security Center Administration Console.

2. In Kaspersky Security Center, expand the **Advanced** node.
3. Expand the **Remote installation** child node.
4. In the results pane of the **Installation packages** child node, click the **Create installation package** button.
5. Select the **Create installation package for a Kaspersky application** installation package type.
6. Enter the installation package name.
7. Specify the ess.kud file from the Kaspersky Embedded Systems Security distribution kit as the installation package file.

The **End User License Agreement and Privacy Policy** window opens.

8. If you agree to the terms and conditions of End User License Agreement and Privacy Policy, select the **I confirm that I have fully read, understood, and accept the terms and conditions of this End User License Agreement and I am aware and agree that my data will be handled and transmitted (including to third countries) as described in the Privacy Policy. I confirm that I have fully read and understand the Privacy Policy** check boxes in order to proceed with the installation.

You must accept the License Agreement and the Privacy Policy to proceed.

9. To change the set of Kaspersky Embedded Systems Security [components to be installed](#) and the [default installation settings](#) in the installation package:

- a. In Kaspersky Security Center, expand the **Remote installation** node.
- b. In the results pane of the **Installation packages** child node, open the context menu of the created Kaspersky Embedded Systems Security installation package and select **Properties**.
- c. In the **Properties: <name of installation package>** window open the **Settings** section.

In the **Components to install** settings group, select the check boxes next to the names of the Kaspersky Embedded Systems Security components you want to install.

- d. In order to indicate a destination folder other than the default one, specify the folder name and path in the **Destination folder** field.  
The path to the destination folder may contain system environment variables. If the folder does not exist on the protected device, it will be created.

- e. In the **Advanced installation settings** group, configure the following settings:

- [Scan protected device for viruses before installation](#)
- **Enable real-time protection after installation of application**
- **Add Microsoft recommended files to exclusions list**
- **Add Kaspersky recommended files to exclusions list**
- **Enable delayed start of the Kaspersky Security Service at operating system startup**

- f. In the **Properties: <name of installation package>** dialog window, click **OK**.

10. In the **Installation packages** node create a task to remotely install Kaspersky Embedded Systems Security on the selected protected devices (administration group). Configure the task settings.

To learn more about creating and configuring remote installation tasks, see the *Kaspersky Security Center Help*.

11. Run the Kaspersky Embedded Systems Security remote installation task.

Kaspersky Embedded Systems Security will be installed on the protected devices specified in the task.

## Actions to perform after Kaspersky Embedded Systems Security installation

After you install Kaspersky Embedded Systems Security, we recommend that you update Kaspersky Embedded Systems Security databases on the devices, and perform a Critical Areas Scan of the devices if no anti-virus applications with enabled real-time protection were installed on the devices before installation of Kaspersky Embedded Systems Security.

If the protected devices on which Kaspersky Embedded Systems Security was installed are part of the same administration group in the Kaspersky Security Center, you can perform these tasks using the following methods:

1. Create Database Update tasks for the group of protected devices on which Kaspersky Embedded Systems Security was installed. Set the Kaspersky Security Center Administration Server as the update source.
2. Create an On-Demand Scan group task with the Critical Areas Scan status. Kaspersky Security Center evaluates the security status of each protected device in the group based on the results of this task, not based on the results of the Critical Areas Scan task.
3. Create a new policy for the group of protected devices. In the policy properties, in the **Application settings** section, deactivate the scheduled start of local system on-demand scan tasks and the Database Update tasks on the administration group's protected devices in the settings of the **Run local system tasks** subsection.

You can also configure administrator notifications about Kaspersky Embedded Systems Security events.

## Installing the Application Console via Kaspersky Security Center

Detailed information about creating an installation package and a remote installation task is provided in the Kaspersky Security Center Implementation Guide.

*To install the Application Console using a remote installation task:*

1. In the Kaspersky Security Center Administration Console expand the **Advanced** node.
2. Expand the **Remote installation** child node.
3. In the results pane of the Installation packages child node, click the **Create installation package** button. While creating the new installation package:
  - a. In the **New Package Wizard** window, select **Create installation package for specified executable file** as a package type.
  - b. Enter the new installation package name.

- c. Select the `\console\setup.exe` file from the Kaspersky Embedded Systems Security distribution kit folder and select the **Copy entire folder to the installation package** check box.
- d. Use the `ADDLOCAL` command-line option in the **Executable file launch settings (optional)** field to perform installation of the Application Console. The Application Console is installed in the default installation folder. Make sure to specify the "EULA=1" parameter. Otherwise, it is impossible to install components.  
`/s /p "ADDLOCAL=MmcSnapin EULA=1"`

Optionally, in the **Executable file launch settings (optional)** field, you can use the `ADDLOCAL` command-line option to modify the set of components to be installed and the `INSTALLDIR` command-line option to specify the destination folder other than default. For example, to perform a standalone installation of the Application Console in the `C:\KasperskyConsole` folder, use the following command-line option:

```
/s /p "ADDLOCAL=MmcSnapin INSTALLDIR=C:\KasperskyConsole EULA=1"
```

4. In the **Installation packages** child node, create a task to remotely install the Application Console on the selected protected devices (administration group). Configure the task settings.

To learn more about creating and configuring remote installation tasks, see the Kaspersky Security Center Help.

5. Run the remote installation task.

The Application Console is installed on the protected devices specified in the task.

## Uninstalling Kaspersky Embedded Systems Security via Kaspersky Security Center

Dump and trace files are not deleted on uninstalling Kaspersky Embedded Systems Security. You can manually delete dump and trace files from the folder specified during the [configuration of dump and trace files writing](#).

If management of Kaspersky Embedded Systems Security on network devices is password protected, enter the password when creating a task to uninstall multiple applications. If the password protection is not managed centrally by a Kaspersky Security Center policy, Kaspersky Embedded Systems Security will be successfully uninstalled from the devices, on which the entered password matched the set value. Kaspersky Embedded Systems Security will not be uninstalled from other protected devices.

*To uninstall Kaspersky Embedded Systems Security:*

1. In the Kaspersky Security Center Administration Console, create and start an application removal task.
2. In the task, select the uninstallation method (similar to selecting the installation method; see the [previous section](#)) and specify the account that Administration Server will use to access the protected devices. You can uninstall Kaspersky Embedded Systems Security with only the [default uninstallation settings](#).

## Installing and uninstalling via Active Directory group policies

This section describes installing and uninstalling Kaspersky Embedded Systems Security via Active Directory group policies. It also contains information about actions to perform after installing Kaspersky Embedded Systems Security through group policies.

## Installing Kaspersky Embedded Systems Security via Active Directory group policies

You can install Kaspersky Embedded Systems Security on several protected devices via the Active Directory group policy. You can install the Application Console the same way.

The protected devices on which you want to install Kaspersky Embedded Systems Security or the Application Console must be in the same domain and a single organizational unit.

The operating systems on the protected devices on which you want to install Kaspersky Embedded Systems Security using the policy must be of the same bitness (32-bit or 64-bit).

You must have domain administrator rights.

To install Kaspersky Embedded Systems Security, use the `ess_x86.msi` or `ess_x64.msi` installation package. To install the Application Console, use the `esstools.msi` installation package.

Detailed information about the use of Active Directory group policies is provided in the documentation supplied by Microsoft.

*To install Kaspersky Embedded Systems Security (or the Application Console):*

1. Save the msi file corresponding to the bitness (32- or 64-bit) of the installed version of the Microsoft Windows operating system in the public folder on the domain controller.
2. Save the [key file](#) in the same public folder on the domain controller.
3. In the same public folder on the domain controller, create an `install_props.json` file with the contents below, which means that you accept the terms of the License Agreement and the Privacy Policy.

```
{  
  "EULA": "1",  
  "PRIVACYPOLICY": "1"  
}
```
4. On the domain controller create a new policy for the group that the protected devices belong to.
5. Using the **Group Policy Object Editor**, create a new installation package in the **Computer Configuration** node. Specify the path to the msi file for Kaspersky Embedded Systems Security (or Application Console) in UNC (Universal Naming Convention) format.
6. Select the Windows Installer's **Always install with elevated privileges** check box in both the **Computer Configuration** node and in the **User Configuration** node of the selected group.
7. Apply the changes using the `gpupdate /force` command.

Kaspersky Embedded Systems Security will be installed on the protected devices of the group after they have been restarted.

## Actions to perform after Kaspersky Embedded Systems Security installation

After installing Kaspersky Embedded Systems Security on the protected devices, it is recommended that you immediately update the application databases and run a Critical Areas Scan. You can perform these [actions](#) from the Application Console.

You can also configure administrator notifications about Kaspersky Embedded Systems Security events.

## Uninstalling Kaspersky Embedded Systems Security via Active Directory group policies

Dump and trace files are not deleted on uninstalling Kaspersky Embedded Systems Security. You can manually delete dump and trace files from the folder specified during the [configuration of dump and trace files writing](#).

If you used an Active Directory group policy to install Kaspersky Embedded Systems Security (or the Application Console) on the group of protected devices, you can use this policy to uninstall Kaspersky Embedded Systems Security (or the Application Console).

You can uninstall the application only with the default uninstallation parameters.

Detailed information about the use of Active Directory group policies is provided in the documentation supplied by Microsoft.

If application management is password protected, you cannot uninstall Kaspersky Embedded Systems Security using Active Directory group policies.

*To uninstall Kaspersky Embedded Systems Security (or the Application Console):*

1. On the domain controller, select the organizational unit from whose protected devices you want to uninstall Kaspersky Embedded Systems Security or the Application Console.
2. Select the policy created for the installation of Kaspersky Embedded Systems Security and in the **Group Policies Object Editor**, in the **Software installation** node (**Computer Configuration > Software Settings > Software installation**) open the context menu of the Kaspersky Embedded Systems Security (or the Application Console) installation package and select the **All tasks > Remove** command.
3. Select the uninstallation method **Immediately uninstall the software from users and computers**.
4. Apply the changes using the `gpupdate / force` command.

Kaspersky Embedded Systems Security is removed from the protected devices after they are restarted and before logging in to Microsoft Windows.

# Checking Kaspersky Embedded Systems Security functions. Using the EICAR test virus

This section describes the EICAR test virus and how to use the EICAR test virus to check the Real-Time File Protection and On-Demand Scan features of Kaspersky Embedded Systems Security.

## About the EICAR test virus

This test virus is designed to verify the operation of anti-virus applications. It was developed by the European Institute for Computer Antivirus Research (EICAR).

The test virus is not a malicious object and does not contain executable code for your device, but most vendors' anti-virus applications identify it as a threat.

The file containing this test virus is called eicar.com. You can download it from the [EICAR website](#).

Before saving the file in a folder on the device's hard drive, make sure that Real-Time File Protection is disabled on that drive.

The eicar.com file contains a line of text. When scanning the file Kaspersky Embedded Systems Security detects the test threat in this line of text, assigns the **Infected** status to the file, and deletes it. Information about the threat detected in the file will appear in the Application Console and in the task log.

You can use the eicar.com file to check how Kaspersky Embedded Systems Security disinfects the infected objects and how it detects probably infected objects. To do this, open the file using a text editor, add one of the prefixes listed in the table below to the beginning of the line of text in the file, and save the file with a new name, such as eicar\_cure.com.

To make sure that Kaspersky Embedded Systems Security processes the eicar.com file with a prefix, in the **Objects protection** security settings section, set the **All objects** value for the Real-Time Computer Protection tasks and Default On-Demand Scan tasks of Kaspersky Embedded Systems Security.

Prefixes in EICAR files

Prefix	File status after the scan and Kaspersky Embedded Systems Security action
No prefix	Kaspersky Embedded Systems Security assigns the <b>Infected</b> status to the object and deletes it.
SUSP-	Kaspersky Embedded Systems Security assigns the <b>Probably infected</b> status to the object detected by the heuristic analyzer and deletes it since probably infected objects are not disinfects.
WARN-	Kaspersky Embedded Systems Security assigns the <b>Probably infected</b> status to the object (the object's code partly matches the code of a known threat) and deletes it since probably infected objects are not disinfects.
CURE-	Kaspersky Embedded Systems Security assigns the <b>Infected</b> status to the object and disinfects it. If disinfection is successful, the entire text in the file is replaced with the word "CURE".

## Checking the Real-Time File Protection and On-Demand Scan features

After installing Kaspersky Embedded Systems Security, you can confirm that Kaspersky Embedded Systems Security finds objects containing malicious code. To check this, you can use a test [virus from EICAR](#).

*To check the Real-Time File Protection feature:*

1. Download the eicar.com file from the [EICAR website](#). Save it in a public folder on the local drive of any device on the network.

Before you save the file to the folder, make sure that Real-Time File Protection is disabled for the folder.

2. If you want to check that network user notifications are working, make sure that the Microsoft Windows Messenger Service is enabled both on the protected device and on the device where you saved the eicar.com file.
3. Open the Application Console on the protected device.
4. Copy the saved eicar.com file to the local drive of the protected device using one of the following methods:
  - To test notifications through a Terminal Services window, copy the eicar.com file to the protected device after connecting to the protected device using the Remote Desktop Connection utility.
  - To test notifications through the Microsoft Windows Messenger Service, use the device's network places to copy the eicar.com file from the device where you saved it.

Real-Time File Protection is working correctly if the following conditions are met:

- The eicar.com file is deleted from the protected device.
- In the Application Console, the [task log](#) gets the *Critical* status. The log has a new line with information about a threat in the eicar.com file.
- The following Microsoft Windows Messenger Service message appears on the device from which you copied the file: Kaspersky Embedded Systems Security blocked access to <path to file on the device>\eicar.com on computer <network name of the device> at <time that event occurred>. Reason: Threat detected. Virus: EICAR-Test-File. User name: <user name>. Computer name: <network name of the device from which you copied the file>.

Make sure that the Microsoft Windows Messenger Service is running on the device from which you copied the eicar.com file.

*To check the On-Demand Scan feature:*

1. Download the eicar.com file from the [EICAR website](#). Save it in a public folder on the local drive of any device on the network.

Before you save the file to the folder, make sure that Real-Time File Protection is disabled for the folder.

2. [Open the Application Console](#) and expand the **On-Demand Scan** node in the Application Console tree.
3. Select the **Critical Areas Scan** child node.
4. On the **Scan scope settings** tab, open the context menu on the **Network** node and select **Add network file**.
5. Enter the network path to the eicar.com file on the remote device in UNC (Universal Naming Convention) format.
6. Select the **Path to object** check box to include the added network path in the scan scope.
7. Run the Critical Areas Scan task.

The On-Demand Scan is working as it should if the following conditions are met:

- The eicar.com file is deleted from the device's hard drive.
- In the Application Console, the [task log](#) gets the *Critical* status. The Critical Areas Scan task log has a new line with information about a threat in the eicar.com file.

# Application interface

You can control Kaspersky Embedded Systems Security using the following interfaces:

- Local Application Console.
- Kaspersky Security Center Administration Console.
- Kaspersky Security Center Web Console.
- Kaspersky Security Center Cloud Console.

## Kaspersky Security Center Administration Console

Kaspersky Security Center lets you remotely install and uninstall, start and stop Kaspersky Embedded Systems Security, configure application settings, change the set of available application components, add keys, and start and stop tasks.

The application can be managed via Kaspersky Security Center using the Kaspersky Embedded Systems Security Administration Plug-in. See detailed information about the Kaspersky Security Center interface in the *Kaspersky Security Center Help*.

## Kaspersky Security Center Web Console and Cloud Console

Kaspersky Security Center Web Console (hereinafter also referred to as Web Console) is a web application intended for centrally performing the main tasks to manage and maintain the security system of an organization's network. Web Console is a Kaspersky Security Center component that provides a user interface. For detailed information about Kaspersky Security Center Web Console, please refer to the *Kaspersky Security Center Help*.

Kaspersky Security Center Cloud Console (hereinafter also referred to as the Cloud Console) is a cloud-based solution for protecting and managing an organization's network. For detailed information about Kaspersky Security Center Cloud Console, please refer to the *Kaspersky Security Center Cloud Console Help*.

Web Console and Cloud Console let you do the following:

- Monitor the status of your organization's security system.
- Install Kaspersky applications on devices within your network.
- Manage installed applications.
- View reports on the security system status.

# Application licensing

This section provides information about the main concepts related to licensing of the application.

## About the End User License Agreement

The *End User License Agreement* is a binding agreement between you and AO Kaspersky Lab, stipulating the terms on which you may use the application.

Carefully review the terms of the End User License Agreement before you start using the application.

You can read the terms of the End User License Agreement and the Privacy Policy, that describes processing and transmission of data, in the following ways:

- During the [installation of Kaspersky Embedded Systems Security](#).
- From the **Start** menu (**All programs > Kaspersky Embedded Systems Security > EULA and Privacy Policy**) after the installation.
- During the installation of Kaspersky Fraud Prevention Cloud.
- By reading the file license.txt document included in the [distribution kit](#).
- On the Kaspersky web site (<https://www.kaspersky.ru/business/eula>).

By confirming that you agree with the End User License Agreement when installing the application, you signify your acceptance of the terms of the End User License Agreement. If you do not accept the terms of the End User License Agreement, you must abort application installation and must not use the application.

## About the license

A *license* is a time-limited right to use the application, granted under the End User License Agreement.

A valid license entitles you to receive use of the application in accordance with the terms of the End User License Agreement as well as receive technical support when necessary.

The scope of service and the period of application use depend on the type of license used to activate the application.

You can activate the application in two ways:

- Using a key file, which grants you the usage under the commercial license
- Using an activation code to purchase a commercial license.

You can purchase Kaspersky Embedded Systems Security standard license or Kaspersky Embedded Systems Security Compliance Edition extended license, which includes three additional system inspection components: File Integrity Monitor, Log Inspection and Registry Access Monitor.

When a commercial license expires, the application continues to run, but the following features become unavailable:

- Integrating with Kaspersky Security Network
- Kaspersky Embedded Systems Security database update

If you remove a license key, the application continues to run; the **On-Demand Scan** and **Real-Time File Protection** tasks remain available, but all other tasks and Kaspersky Embedded Systems Security database updates are unavailable. The same happens if Kaspersky adds your license to the denylist.

To continue using all Kaspersky Embedded Systems Security features, you must renew your the license.

To ensure maximum protection of your device, we recommend that you renew the license before it expires.

Make sure that the expiration date for the additional key is later than for the active one

## About license certificate

A *license certificate* is a document that you receive along with a key file or an activation code (if applicable).

A license certificate contains the following information about the current license:

- Order number
- Information about the user who has been granted the license
- Information about the application that can be activated under the license provided
- Limit of the number of licensing units (e.g., devices on which the application can be used under the license provided)
- License validity start date
- License expiration date or license term
- License type

## About the key

A *key* is a sequence of bits with which you can activate and subsequently use the application in accordance with the terms of the End User License Agreement. A key is generated by Kaspersky.

You can add a key to the application by using a key file. After you add a key to the application, the key is displayed in the application interface as a unique alphanumeric sequence.

Kaspersky can add a key to the denylist due to violations of the License Agreement. If your key is blocked, a different key must be added in order for the application to work.

A key may be an "active key" or an "additional key".

An *active key* is the key that the application currently uses to function. A key for a commercial or trial license may be added as the active key. The application can have no more than one active key.

An *additional key* is a key that confirms the right to use the application but is not currently in use. An additional key automatically becomes active when the license associated with the current active key expires. An additional key may be added only if there is an active key.

## About the key file

A *key file* is a file with the .key extension provided to you by Kaspersky. Key files are designed to activate the application by adding a license key.

You receive a key file at the email address that you provided when you bought Kaspersky Embedded Systems Security or ordered the trial version of Kaspersky Embedded Systems Security.

You do not need to connect to Kaspersky activation servers in order to activate the application with a key file.

You can restore a key file if it has been accidentally deleted. You may need a key file to register a Kaspersky CompanyAccount, for example.

To restore your key file, perform any of the following actions:

- Contact the license seller.
- Receive a key file through [Kaspersky website](#) by using your available activation code.

## About activation code

An *activation code* is a unique sequence of 20 letters and numbers. You have to enter an activation code in order to add a key for activating Kaspersky Embedded Systems Security. You receive the activation code at the email address that you provided when you bought Kaspersky Embedded Systems Security or ordered the trial version of Kaspersky Embedded Systems Security.

To activate the application with an activation code, you need Internet access in order to connect to Kaspersky activation servers.

If you have lost your activation code after installing the application, it can be recovered. You may need the activation code to register a Kaspersky CompanyAccount, for example. To recover your activation code, contact the Kaspersky Lab partner from whom you purchased the license.

## About data provision

The License Agreement for Kaspersky Embedded Systems Security, specifically the section entitled "Terms of data processing", specifies the terms, liability, and procedure for sending and processing the data indicated in this Guide. Before accepting the License Agreement, carefully review its terms as well as all documents linked to by the License Agreement.

The data Kaspersky receives from you when you use the application is protected and processed in accordance with the Privacy Policy available at [www.kaspersky.com/Products-and-Services-Privacy-Policy](http://www.kaspersky.com/Products-and-Services-Privacy-Policy).

The terms of the License Agreement and Privacy Policy are available during the [Kaspersky Embedded Systems Security installation](#), as a part of [distribution kit](#), and from the **Start** menu (**All programs > Kaspersky Embedded Systems Security > EULA and Privacy Policy**) after the installation.

During the Kaspersky Embedded Systems Security uninstallation, all the data stored by Kaspersky Embedded Systems Security on the protected device is deleted.

By accepting the terms of the License Agreement, you agree to automatically send the following data to Kaspersky:

- To support the mechanism for receiving updates – information about the installed application and its activation: identifier of the application being installed and its full version, including build number, type, and license identifier, installation identifier, update task identifier.
- To use the ability to navigate to Knowledge Base articles when application errors occur (Redirector service) – information about the application and link type: the name, locale, and full version number of the application, type of redirecting link, and error identifier.
- To manage confirmations for data processing – information about the status of acceptance of license agreements and other documents, that stipulate data transferring terms: identifier and version of the License Agreement or other document, as a part of which the data processing terms are accepted or declined; an attribute, signifying the user's action (confirmation or recall of the terms acceptance); date and time of status changes of the data processing terms acceptance.

## Local data processing

While executing the application primary functions described in this Guide, Kaspersky Embedded Systems Security locally processes and stores a sequence of data on the protected computer.

The table below contains information about local processing and storing by Kaspersky Embedded Systems Security of data contained in reports.

Processing and storing of data contained in reports

Functional area	<a href="#">Event registration</a>
Type of use	Kaspersky Embedded Systems Security stores the data locally and sends the data to the Administration Server. The Administration Server database stores information about application events that occur on the managed protected devices.
Storage	<ul style="list-style-type: none"> <li>• %ALLUSERSPROFILE%\Kaspersky Lab\Kaspersky Embedded Systems Security\<product version="">\Reports</product></li> <li>• %SystemRoot%\System32\Winevt\Logs\Kaspersky Security.evtx</li> <li>• Administration Server database</li> </ul>
Security measures	Access-control list.
Storage period	<p>Kaspersky Embedded Systems Security stores the data until the uninstallation of Kaspersky Embedded Systems Security.</p> <p>During the Kaspersky Embedded Systems Security uninstallation, all the data stored by Kaspersky Embedded Systems Security on the protected device is deleted.</p>

Purpose	Providing primary functionality.
---------	----------------------------------

Kaspersky Embedded Systems Security does not delete events in the Windows Event Log including during the Kaspersky Embedded Systems Security uninstallation.

In order to provide event registration functionality, Kaspersky Embedded Systems Security locally processes the following data:

- Names, checksums (MD5, SHA-256) and attributes of processed files and full paths to them on the scanned media.
- Actions taken on scanned files by Kaspersky Embedded Systems Security.
- User actions taken on scanned files on the protected computer.
- Information about accounts of users performing any actions on the protected network or protected device.
- Device Instance Path values for devices added to the Device Control rules.
- Information about processes and scripts running on the system: checksums (MD5, SHA-256) and full paths to executable files, information about digital certificates.
- Windows Firewall settings.
- Windows Event Log entries.
- Names of user accounts taking actions on scanned files on the protected computer.
- Instances of executable files being started, and the types, names, checksums, and attributes of these files.
- Information about network activity:
  - The IP addresses of blocked external devices.
  - Processed IP addresses.
- Information about the Windows USN Journal status.

The following table contains information about the service data processed by the Kaspersky Embedded Systems Security. The service data includes: program parameters, quarantined and backup files, information in the program's service databases, license data.

The table below contains information about local processing and storing by Kaspersky Embedded Systems Security of data about parameters specified by a user.

Processing and storing of data about parameters specified by a user

Functional area	All Kaspersky Embedded Systems Security functionality
Type of use	Kaspersky Embedded Systems Security stores the data locally and sends the data to the Administration Server. The data is stored in Administration Server database.  The data processed by the application locally is not automatically sent to Kaspersky or other third-party systems.
Storage	<ul style="list-style-type: none"> <li>• %ALLUSERSPROFILE%\Kaspersky Lab\Kaspersky Embedded Systems Security\&lt;product</li> </ul>

	version>\ <ul style="list-style-type: none"> <li>Administration Server database</li> </ul>
Security measures	Access-control list.
Processing period	<p>Kaspersky Embedded Systems Security stores the data until the uninstallation of Kaspersky Embedded Systems Security.</p> <p>During the Kaspersky Embedded Systems Security uninstallation, all the data stored by Kaspersky Embedded Systems Security on the protected device is deleted.</p> <p>Kaspersky Embedded Systems Security does not delete the data about parameters exported into configuration file.</p> <p>Kaspersky Embedded Systems Security does not delete Quarantine objects and Backup objects if the <b>Export quarantine objects</b> and <b>Export Backup objects</b> check boxes are selected in the Setup Wizard.</p>
Purpose	Providing primary functionality.

For specified purposes, Kaspersky Embedded Systems Security locally processes the following data:

- Objects placed in Quarantine or Backup.
- Information about user accounts (username and password) under which Kaspersky Embedded Systems Security runs tasks.
- Kaspersky Embedded Systems Security password.
- IP addresses and identifiers of blocked logon sessions.
- Windows Firewall settings and Windows Firewall rules settings.
- Checksums (MD5, SHA-256) and paths to executable files added to the Application Launch Control task rules.
- Device Instance Path values for devices added to the Device Control rules.
- Information about files and folders included in scopes of Kaspersky Embedded Systems Security tasks.
- IP addresses included or excluded from the protection scope.
- Information about events in the Windows Event Log.
- Information about detections with the use of iSwift or iChecker technology.
- Checksums (MD5, SHA-256), full paths and masks specified in exclusions settings.
- Information about processes added to the Trusted Zone.
- Information about added license keys.
- Information about digital certificates.
- Files unpacked from an archive or other composite object during the scan.

Kaspersky Embedded Systems Security processes and stores data as part of the application basic functionality, including to log application events and receive diagnostic data. Locally processed data is protected in accordance with the configured and applied application settings.

Kaspersky Embedded Systems Security lets you configure the level of protection for data processed locally ([Managing access permissions for Kaspersky Embedded Systems Security functions](#), [Event registration](#), [Kaspersky Embedded Systems Security logs](#)): you can change user privileges to access process data, change data retention periods for such data, entirely or partially disable functionality that involves data logging, and change the path and attributes of the folder where the data is logged.

The data processed by the application locally is not automatically sent to Kaspersky or other third-party systems.

By default, all data locally processed by the application during operation is removed after Kaspersky Embedded Systems Security removal from the protected device.

Exception applies to files with diagnostics information (trace and dump files), the application events in the Windows Event Log, and files with exported Kaspersky Embedded Systems Security settings - it is recommended to manually remove these files.

You can find the detailed information about working with files containing diagnostic data of the application in the corresponding sections of this Guide.

You can delete Windows Event Log files containing the program events of Kaspersky Embedded Systems Security via standard means of the operating system.

## Local data processing by means of the application auxiliary components

The Kaspersky Embedded Systems Security installation package comprises the application auxiliary components, which can be installed on your device even if Kaspersky Embedded Systems Security is not installed on it. Such auxiliary components are:

- The Application Console. This component is included in the Kaspersky Embedded Systems Security Administration Tools set and is represented by a Microsoft Management Console snap-in.
- The Administration Plug-in. This component provides a full integration with Kaspersky Security Center application.

While performing the main functions of the application described in this Guide, the application auxiliary components locally process and store a set of data on the protected device where they are installed, even if they are installed separately from Kaspersky Embedded Systems Security.

The application components locally process and store the following data:

- The Application Console: the name of the protected device with installed Kaspersky Embedded Systems Security (IP address or domain name) to which the Application Console last connected remotely; display parameters configured in the Microsoft Management Console snap-in; data about the last folder in which the user selected objects via the Application Console (by means of system dialog opened by clicking the **Browse** button). The Application Console trace files can also contain the following data: the name of the protected device with installed Kaspersky Embedded Systems Security application to which the remote connection was established, the name of the user account under which the remote connection was established.
- The Administration Plug-in can process and temporarily store data processed by Kaspersky Embedded Systems Security; for example, configured parameters of the application tasks and components, parameters of Kaspersky Security Center policies, data sent in network lists.

The table below contains information about local processing and storing by Kaspersky Embedded Systems Security of data written in dump and trace files.

Kaspersky Embedded Systems Security locally processes and stores the following data written in dump and trace files:

- Information about actions performed by Kaspersky Embedded Systems Security on the protected device.
- Information about objects processed by Kaspersky Embedded Systems Security.
- Information about activity on the protected device processed by Kaspersky Embedded Systems Security.
- Information about errors that occurred during the running of Kaspersky Embedded Systems Security.

The data processed by the auxiliary components is not automatically sent to Kaspersky or other third-party systems.

By default, all data locally processed by the application auxiliary components during the operation is deleted after removal of these components.

The exceptions are trace files of the application auxiliary components, it is recommended to delete this files manually.

## Data in trace and dump files

Kaspersky Embedded Systems Security can, in accordance with the settings, write debug information to trace files for the purposes of technical support during the operation of Kaspersky Embedded Systems Security.

Kaspersky Embedded Systems Security dump files are generated by the operating system during application crashes and are overwritten by the next crash.

Trace and dump files can include any personal data of a user or confidential data of your organization.

Do not use Kaspersky Embedded Systems Security on devices for which data submission is prohibited by the policy of your organization.

By default, Kaspersky Embedded Systems Security does not record debug information.

Trace and dump files are not automatically submitted beyond the host on which they were generated. The content of trace files can be viewed using standard text file viewers. Trace and dump files are kept indefinitely and are not deleted on uninstalling Kaspersky Embedded Systems Security.

Debug information can be useful for Technical Support.

No special mechanisms are provided for limiting access to trace and dump files. The administrator can configure this data to be written to a protected folder.

The path to the trace and dump file folder is not configured by default. To use the trace and dump folder, the administrator must specify it.

Data in trace and dump files can contain:

- Actions performed by Kaspersky Embedded Systems Security on the host.

- Information about objects processed by Kaspersky Endpoint Agent.
- Errors arising during the operation of Kaspersky Endpoint Agent.

## Activating the application with a key file

You can activate Kaspersky Embedded Systems Security by applying a key file.

If an active key has already been added to Kaspersky Embedded Systems Security and you add another key as the active key, the new key replaces the previously added key. The previously added key is removed.

If an additional key has already been added to Kaspersky Embedded Systems Security and you add another key as an additional key, the new key replaces the previously added key. The previously added additional key is removed.

If an active key and an additional key have already been added to Kaspersky Embedded Systems Security and you add a new key as the active key, the new key replaces the previously added active key; the additional key is not removed.

*To activate Kaspersky Embedded Systems Security using a key file:*

1. In the Application Console tree, expand the **Licensing** node.
2. In the results pane of the **Licensing** node, click the **Add key** link.
3. In the window that opens, click the **Browse** button.
4. Select a key file with the .key extension.

You can also add a key as an additional key. To add a key as an additional key, select the **Use as additional key** check box.

5. Click **OK**.

The selected key file will be applied. Information about the added key will be available on the **Licensing** node.

## Activating the application with an activation code

To activate the application using an activation code, the protected device must be connected to the Internet.

You can activate Kaspersky Embedded Systems Security by using an activation code.

When activating the application with this method, Kaspersky Embedded Systems Security sends data to the activation server to verify the entered code:

- If the activation code verification is successful, the application is activated.
- If the activation code verification fails, the corresponding notification is displayed. In this case, you must contact the software vendor from whom you purchased your Kaspersky Embedded Systems Security license.

- If the number of activations with the activation code is exceeded, the corresponding notification is displayed. The application activation procedure is interrupted, and the application suggests that you contact Kaspersky Technical Support.

You can activate Kaspersky Embedded Systems Security with an activation code using the Application Console, or by creating the Activation of the Application group task [via the Administration Plug-in](#) or [via the Web Plug-in](#).

*To activate Kaspersky Embedded Systems Security with an activation code using the Application Console:*

1. In the Application Console tree, expand the **Licensing** node.
2. In the results pane of the **Licensing** node, click the **Add activation code** link.
3. In the window that opens, enter the activation code in the **Activation code** field.
  - If you want to use the activation code as an additional key, enable **Use as additional key** check box.
  - If you want to view the license information, click the **Show license information** button; it will be displayed in the **License information** group box.
4. Click **OK**.

Kaspersky Embedded Systems Security sends information about the applied activation code to the activation server.

## Viewing information about the current license

### Viewing licensing information

Information about the current license is displayed in the details pane of the **Kaspersky Embedded Systems Security** node of the Application Console. A key can have the following statuses:

- **Checking the key status** – Kaspersky Embedded Systems Security is checking the applied key file or activation code and waiting for a response about the current key status.
- **License expiration date** – Kaspersky Embedded Systems Security has been activated until the specified date and time. The key status is highlighted in yellow in the following cases:
  - The license will expire in 14 days and no additional key has been applied.
  - The added key has been added to the denylist and is about to be blocked.
- **License has expired** – Kaspersky Embedded Systems Security is not activated because the license has expired. The status is highlighted in red.
- **End User License Agreement has been violated** – Kaspersky Embedded Systems Security is not activated because the terms of the [End User License Agreement](#) have been violated. The status is highlighted in red.
- **Key is in denylist** – The added key has been blocked and added to the denylist by Kaspersky, for example, if the key has been used by third parties to activate the application illegally. The status is highlighted in red.

### Viewing information about the current license

To view information about the current license,

in the Application Console tree, expand the **Licensing** node.

General information about the current license is displayed in the details pane of the **Licensing** node (see the table below).

General information about the license in the Licensing node

Field	Description
<b>Activation code</b>	The activation code. This field is filled in if you activate the application using an activation code.
<b>Activation status</b>	Information about the activation status of the application. The <b>Activation status</b> column of the <b>Licensing</b> node's details pane can have the following statuses: <ul style="list-style-type: none"> <li>• <b>Applied</b> – if you have activated the application using an activation code or key file.</li> <li>• <b>Activation</b> – if you have applied an activation code to activate the application, but the activation process has not been finalized yet. The status changes to <b>Applied</b> after activation of the application is complete and the contents of the node's details pane are refreshed.</li> <li>• <b>Activation error</b> – if application activation failed. You can view the cause of unsuccessful activation in the task log.</li> </ul>
<b>Key</b>	The key used to activate the application.
<b>License type</b>	License type: commercial or trial.
<b>Expiration date</b>	Expiration date and time of the license associated with the active key.
<b>Activation code status or key status</b>	Activation code status or key status: <i>Active</i> or <i>Additional</i> .

To view detailed information about the license,

on the **Licensing** node, open the context menu on the line with license data that you want to expand and select **Properties**.

In the **Key properties** window, the **General** tab displays detailed information about the current license, and the **Advanced** tab displays information about the customer and the contact details of Kaspersky or the retailer from whom you purchased Kaspersky Embedded Systems Security (see the table below).

Detailed license information in the Properties: <Activation code status or key status> window

Field	Description
<b>General tab</b>	
<b>Key</b>	The key used to activate the application.
<b>Key addition date</b>	Date when the key was added to the application.
<b>License type</b>	License type: commercial or trial.

<b>Days till expiration</b>	Number of days remaining until the expiration of the license associated with the active key.
<b>Expiration date</b>	Expiration date and time of the license associated with the active key. If you activate the application under an unlimited subscription, the field value is <i>Unlimited</i> . If Kaspersky Embedded Systems Security is unable to determine the license expiration date, the field value is <i>Unknown</i> .
<b>Application</b>	The name of the application activated with the key file or activation code.
<b>Key usage restriction</b>	Restriction on use of the key (if any).
<b>Eligible for technical support</b>	Information on whether Kaspersky or one of its partners will provide technical support under the license terms.
<b>Advanced tab</b>	
<b>Information about the license</b>	Current license key.
<b>Support information</b>	Contact details of Kaspersky or its partner providing technical support. This field may be empty if technical support is not provided.
<b>Owner information</b>	Information about the license owner: a customer name and the name of the organization for which the license was acquired.

## Functional limitations when the license expires

When the current license expires, the following limitations are applied to the functional components:

- All tasks are stopped, except the Real-Time File Protection, On-Demand Scan and Application Integrity Control tasks.
- You cannot start any tasks except the Real-Time File Protection, On-Demand Scan and Application Integrity Control. These tasks continue to run using the old anti-virus databases.
- Exploit Prevention functionality is limited:
  - Processes are protected until they are restarted.
  - New processes cannot be added to the protection scope.

Other functions (repositories, logs, diagnostic information) are still available.

## Renewing the license

By default, when the license has 14 days remaining before expiration, Kaspersky Embedded Systems Security notifies you about the approaching expiration. In this case, the **License expiration date** status is highlighted in yellow in the results pane of the **Kaspersky Embedded Systems Security** node.

You can renew the license before the expiration date using an additional key. This ensures that your device remains protected after expiration of the current license and before you activate the application with a new license.

*To renew a license:*

1. Obtain a new activation code or a key file.
2. In the Application Console tree, open the **Licensing** node.
3. Perform one of the following actions in the results pane of the **Licensing** node:
  - If you want to renew a license using a key file:
    - a. Click the **Add key** link.
    - b. In the window that opens, click the **Browse** button.
    - c. Select a new key file with the .key extension.
    - d. Select the **Use as additional key** check box.
  - If you want to renew a license using an activation code:
    - a. Click the **Add activation code** link.
    - b. Enter the purchased activation code in the window that opens.
    - c. Select the **Use as additional key** check box.

An Internet connection is required to apply an activation code.

4. Click **OK**.

The additional key will be added and automatically applied upon expiration of the current Kaspersky Embedded Systems Security license.

## Deleting the key

You can remove the added key.

If an additional key has been added to Kaspersky Embedded Systems Security and you remove the active key, the additional key automatically becomes the active key.

If you delete an added key, you can restore it by re-applying the key file.

*To remove a key that has been added:*

1. In the Application Console tree, select the **Licensing** node.
2. In the results pane of the **Licensing** node in the table containing information on added keys, select the key that you want to remove.
3. In the context menu of the line containing information on the selected key, select **Remove**.

4. Click the **Yes** button in the confirmation window to confirm that you want to delete the key.

The selected key will be removed.

## Working with the Administration Plug-in

This section provides information about the Kaspersky Embedded Systems Security Administration Plug-in and describes how to manage the application installed on a protected device or on a group of protected devices.

## Managing Kaspersky Embedded Systems Security from Kaspersky Security Center

You can centrally manage several protected devices with Kaspersky Embedded Systems Security installed and included in an administration group via the Kaspersky Embedded Systems Security Administration Plug-in. Kaspersky Security Center can also separately configure each protected device in the administration group.

*An administration group is created manually via Kaspersky Security Center. The group includes several devices with Kaspersky Embedded Systems Security installed and for which you want to configure the same control and protection settings. For details on using administration groups, see [Kaspersky Security Center Help](#).*

Application settings for a single protected device are unavailable if the operation of Kaspersky Embedded Systems Security on the protected device is controlled by an active Kaspersky Security Center policy.

Kaspersky Embedded Systems Security can be managed from Kaspersky Security Center in the following ways:

- **Using Kaspersky Security Center policies.** Kaspersky Security Center policies can be used to remotely define the same protection settings for a group of devices. Task settings specified in the active policy have priority over task settings configured locally in the Application Console or remotely in the **Properties: <Protected device name>** window of Kaspersky Security Center.

You can use policies to configure general application settings, Real-Time Computer Protection task settings, Local Activity Control tasks settings, and scheduled local system task start settings.

- **Using Kaspersky Security Center group tasks.** Kaspersky Security Center group tasks allow remote configuration of common settings of tasks with an expiration period for a group of devices.  
You can use group tasks to activate the application, configure On-Demand Scan task settings, update task settings, and Rule Generator for Applications Launch Control task settings.
- **Using tasks for a set of devices.** Tasks for a set of devices allow remote configuration of common task settings with a limited execution period for protected devices that do not belong to any administration group.
- **Using the properties window of a single device.** In the **Properties: <Protected device name>** window, you can remotely configure the task settings for a single protected device included in an administration group. You can also configure both general application settings and settings for all Kaspersky Embedded Systems Security tasks if the selected protected device is not controlled by an active Kaspersky Security Center policy.

Kaspersky Security Center allows you to configure application settings and advanced features, and also work with logs and notifications. You can configure these settings for a group of protected devices and for an individual protected device.

## Managing application settings

This section contains information about configuring Kaspersky Embedded Systems Security general settings in Kaspersky Security Center Web Console.

## Navigation

Learn how to navigate to the required task settings via the chosen interface.

### Opening general settings via the policy

*To open the application settings of the Kaspersky Embedded Systems Security via the policy:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Policies** tab.
4. Double-click the policy name you want to configure.
5. In the **Properties: <Policy name>** window that opens, select the **Application settings** section.
6. Click the **Settings** button in the subsection of the setting that you want to configure.

### Opening general settings in the application properties window

*To open the properties window of the Kaspersky Embedded Systems Security for a single protected device:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Devices** tab.
4. Open the **Properties: <Protected device name>** window in one of the following ways:
  - Double-click the name of the protected device.
  - Select the **Properties** item in the context menu of the protected device.

The **Properties: <Protected device name>** window opens.

5. In the **Applications** section, select **Kaspersky Embedded Systems Security 3.2**.
6. Click the **Properties** button.

The **Kaspersky Embedded Systems Security 3.2 settings** window opens.
7. Select the **Application settings** section.

# Configuring general application settings in Kaspersky Security Center

You can configure Kaspersky Embedded Systems Security general settings from Kaspersky Security Center for a group of protected devices or for one protected device.

## Configuring scalability, interface, and scan settings in Kaspersky Security Center

*To configure scalability, interface, and scan settings:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Application settings** section, in the **Scalability, interface and scan settings** subsection, click **Settings**.
5. In the **Advanced application settings** window on the **General** tab, configure the following settings:
  - In the **Scalability settings** section, configure the settings that define the number of processes used by Kaspersky Embedded Systems Security:
    - [Automatically detect scalability settings](#)
    - [Set the number of working processes manually](#)
      - [Number of processes for real-time protection](#)
      - [Number of processes for background on-demand scan tasks](#)
  - In the **Interaction with user** section, configure whether the System Tray Icon will be displayed in the notification area by clearing or selecting the **Display System Tray Icon in the taskbar** check box.
6. On the **Scan settings** tab, configure the following settings:
  - [Restore file attributes after scanning](#)
  - [Limit CPU usage for scanning threads](#)

- [Upper limit \(per cent\) ?](#)

- [Folder for temporary files created during scanning ?](#)

7. On the **Hierarchical storage** tab, select the option for accessing the hierarchical storage.

8. Click **OK**.

The configured application settings are saved.

## Configuring security settings in Kaspersky Security Center

*To configure security settings manually:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.

2. Select the administration group for which you want to configure application settings.

3. Perform one of the following actions in the details pane of the selected administration group:

- To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
- To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Application settings** section, click the **Settings** button in the **Security and reliability** subsection.

5. In the **Security settings** window, configure the following settings:

- In the **Password protection settings** section, enable or disable the [Protect application processes from external threats ?](#) option.
- In the **Password protection settings** section, set a password to protect access to Kaspersky Embedded Systems Security functions.
- In the **Self-defense** section, configure the settings for recovery of Kaspersky Embedded Systems Security tasks when the application returns an error or terminates.
  - [Perform task recovery ?](#)
  - [Reliability settings ?](#)
- In the **Recover on-demand scan tasks no more than (times)** section, specify limitations on protected device load created by Kaspersky Embedded Systems Security after switching to UPS power:
  - [Do not start scheduled scan tasks ?](#)
  - [Stop current scan tasks ?](#)

- In the **Password protection settings** section, set a password to protect access to Kaspersky Embedded Systems Security functions.

6. Click **OK**.

The scalability and reliability settings are saved.

## Configuring connection settings using Kaspersky Security Center

The configured connection settings are used to connect Kaspersky Embedded Systems Security to update and activation servers and during integration of applications with KSN services.

*To configure the connection settings take the following steps:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Application settings** section, click the **Settings** button in the **Connections** subsection.

The **Connection settings** window opens.

5. In the **Connection settings** window, configure the following settings:

- In the **Proxy server settings** section, select the proxy server usage settings:
  - [Do not use proxy server](#)
  - [Use the specified proxy server](#)
  - IP address or symbolic name of the proxy server and the port number.
  - [Do not use proxy server for local addresses](#)
- In the **Proxy server authentication settings** section, specify the authentication settings:
  - Select the authentication settings in the drop-down list.
    - **Do not use authentication** – authentication is not performed. This mode is selected by default.
    - **Use NTLM authentication** – authentication is performed using the NTLM network authentication protocol developed by Microsoft.

- **Use NTLM authentication with user name and password** – authentication is performed with a user name and password using the NTLM network authentication protocol developed by Microsoft.
- **Apply user name and password** – authentication is performed using the user name and password.
- Enter the user name and password, if needed.
- In the **Licensing** section, clear or select the **Use Kaspersky Security Center as a proxy server when activating the application**.

6. Click **OK**.

The configured connection settings are saved.

## Configuring scheduled start of local system tasks

You can use policies to allow or block start of the local system On-Demand Scan task and the Update task according to the schedule configured locally on each protected device in the administration group:

- If the scheduled start of a specific type of local system task is prohibited by a policy, these tasks will not be performed on the protected device according to the schedule. You can start local system tasks manually.
- If the scheduled start of a specific type of local system task is allowed by a policy, these tasks will be performed in accordance with the scheduled parameters configured locally for this task.

By default, starting a local system task is prohibited by policy.

We recommend that you do not allow local system tasks to start if updates or on-demand scans are administered by Kaspersky Security Center group tasks.

If you do not use group update or on-demand scan tasks, allow local system tasks to be started in the policy. Kaspersky Embedded Systems Security will perform application database and module updates, and start all local system on-demand scan tasks in accordance with the default schedule.

You can use policies to allow or block the scheduled start of the following local system tasks:

- On-Demand Scan tasks: Critical Areas Scan, Quarantine Scan, Scan at Operating System Startup, Application Integrity Control, Baseline File Integrity Monitor.
- Update tasks: Database Update, Software Modules Update, Copying Updates.

If the protected device is excluded from the administration group, the local system tasks schedule will be enabled automatically.

*To allow or block the scheduled start of Kaspersky Embedded Systems Security local system tasks in a policy:*

1. In the **Managed devices** node in the Administration Console tree, expand the required group and select the **Policies** tab.
2. On the **Policies** tab, in the context menu of the policy for which you want to schedule Kaspersky Embedded Systems Security local system tasks for the group of protected devices, select **Properties**.

3. In the **Properties: <Policy name>** window, open the **Application settings** section. In the **Run local system tasks** section, click the **Settings** button and do one of the following:

- Select the **On-demand scan tasks** and **Update tasks and Copying Update task** check boxes to allow the scheduled launch of the listed tasks.
- Clear the **On-demand scan tasks** and **Update tasks and Copying Update task** check boxes to disable the scheduled launch of the listed tasks.

Selecting or clearing the check box will not affect the start settings of any local custom tasks of this type.

4. Make certain that the policy you are configuring is active and applied to the selected group of protected devices.

5. Click **OK**.

The configured task schedule settings are applied for the selected tasks.

## Configuring Quarantine and Backup settings in Kaspersky Security Center

*To configure general Backup settings in Kaspersky Security Center:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Supplementary** section, click the **Settings** button in the **Storages** subsection.

5. Use the **Backup** tab of the **Storages settings** window to configure the following Backup settings:

- To specify the backup folder, use the **Backup folder** field to select the required folder on the local drive of the protected device, or enter its full path.
- To set the maximum Backup size, select the **Maximum Backup size (MB)** check box and specify the relevant value in megabytes in the entry field.
- To set the Backup free space threshold:
  - Define the value of the **Maximum Backup size (MB)** setting.
  - Select the **Threshold value for space available (MB)** check box.

- Specify the minimum value of free space in the Backup folder in megabytes.
- To specify a folder for restored objects, do one of the following:
  - Select the relevant folder on a local drive of the protected device in the **Restoration settings** section.
  - Enter the name of the folder and the full path to it in the **Target folder for restoring objects** field.

6. In the **Storages settings** window on the **Quarantine** tab, configure the following Quarantine settings:

- To change the Quarantine folder, in the **Quarantine folder** entry field specify the complete path to the folder on the local drive of the protected device.
- To set the maximum Quarantine size, select the **Maximum Quarantine size (MB)** check box and specify the value of this parameter in megabytes in the entry field.
- To set the minimum amount of free space in Quarantine, select the **Maximum Quarantine size (MB)** check box and the **Threshold value for space available (MB)** check box, and then specify the value of this parameter in megabytes in the entry field.
- To change the folder to which objects are restored from Quarantine, in the **Target folder for restoring objects** field specify the complete path to the folder on the local drive of the protected device.

7. Click **OK**.

The configured Quarantine and Backup settings are saved.

## Creating and configuring policies

This section provides information on using Kaspersky Security Center policies for managing Kaspersky Embedded Systems Security on several protected devices.

Global Kaspersky Security Center policies can be created to manage protection on several devices where Kaspersky Embedded Systems Security is installed.

A policy enforces the Kaspersky Embedded Systems Security settings, functions and specified tasks on all the protected devices for one administration group.

Several policies for one administration group can be created and enforced in turns. The policy currently active for a group has *active* status in the Administration Console.

Information on policy enforcement is logged in the Kaspersky Embedded Systems Security system audit log. This information can be viewed in the Application Console in the **System audit log** node.

Kaspersky Security Center offers one way to apply policies on protected devices: *Prohibit changing the settings*. After a policy has been applied, Kaspersky Embedded Systems Security uses the values of settings for which you have selected the  icon in the policy properties on protected devices. In this case, Kaspersky Embedded Systems Security does not use the values of settings in effect before the policy was applied. Kaspersky Embedded Systems Security does not apply the values of active policy settings for which the  icon is selected in the policy properties.

If a policy is active, the values of settings marked with the  icon in the policy are displayed in the Application Console but cannot be edited. The values of other settings (marked with the  icon in the policy) can be edited in the Application Console.

The settings configured in the active policy and marked with the  icon also block changes in Kaspersky Security Center for one protected device in the **Properties: <Protected device name>** window.

Settings that are specified and sent to the protected device using an active policy are saved in the local task settings after the active policy is disabled.

If the policy defines the settings for a Real-Time Computer Protection task, and if such a task is currently running, then any settings defined by the policy will be modified as soon as the policy is applied. If the task is not running, the settings are applied when it starts.

## Creating a policy

The process of creating a policy involves the following steps:

1. Creating a policy using the policy wizard. The Real-Time Computer Protection tasks settings can be configured using the wizard dialogs.
2. Configuring policy settings. In the **Properties: <Policy name>** window of the created policy, you can define the Real-Time Computer Protection tasks settings, the general settings of Kaspersky Embedded Systems Security, the Quarantine and Backup settings, the level of detail for task logs, as well as user and administrator notifications about Kaspersky Embedded Systems Security events.

*To create a policy for a group of protected devices running the installed Kaspersky Embedded Systems Security:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree, then select the administration group containing the protected devices for which you wish to create a policy.
2. In the details pane of the selected administration group, select the **Policies** tab and click the **Create a policy** link to start the wizard and create a policy.

The **New Policy Wizard** window opens.

3. In the **Select the application for which you want to create a group policy** window, select Kaspersky Embedded Systems Security and click **Next**.
4. Enter a group policy name in the **Name** field.

The policy name cannot contain the following symbols: " \* < : > ? \ | .

5. To apply a policy configuration used in a previous version of the application:
  - a. Select the **Use settings from policy for previous versions of application** check box.
  - b. Click the **Select** button.
  - c. Select the policy you want to apply.
  - d. Click **Next**.
6. In the **Operation type selection** window, select one of the following options:
  - **New**, to create new a policy with default settings.

- **Import policy created with previous versions of Kaspersky Embedded Systems Security**, to use the imported policy as a template.
  - Click **Browse** and select a configuration file with an existing policy.
7. In the **Real-Time Computer Protection** window, configure the Real-Time File Protection, KSN Usage tasks, Exploit Prevention, and Script Monitoring as required. Allow or block the use of configured policy tasks on protected devices on the network:
- Click the  button to allow changes to task settings on network protected devices and block the application of task settings configured in the policy.
  - Click the  button to deny changes to task settings on network protected devices and allow the application of task settings configured in the policy.

The newly created policy uses the default settings of the Real-Time Computer Protection tasks.

- To edit the default settings of the Real-Time File Protection task, click the **Settings** button in the **Real-Time File Protection** subsection. In the window that opens, configure the task according to your needs. Click **OK**.
- To edit the default settings of the KSN Usage task, click the **Settings** button in the **KSN Usage** subsection. In the window that opens, configure the task according to your needs. Click **OK**.

To start the KSN Usage task, you need to accept the KSN Statement in the [KSN data handling window](#).

- To edit the default settings of the Exploit Prevention component, click the **Settings** button in the **Exploit Prevention** subsection. In the window that opens, configure the functionality according to your needs. Click **OK**.
8. Select one of the following policy statuses in the **Create the group policy for the application** window:
- **Active policy** if you want to apply the policy immediately after it is created. If an active policy already exists in the group, it is deactivated and a new policy is applied.
  - **Inactive policy** if you do not want to apply the created policy immediately. In this case the policy may be activated later.
  - Select the **Open policy properties immediately after they are created** check box to automatically close the **New Policy Wizard** and configure the newly created policy after clicking the **Next** button.
9. Click the **Finish** button.

The [created policy](#)  appears in the list of policies on the **Policies** tab of the selected administration group. In the **Properties: <Policy name>** window, you can configure other settings, tasks and functions of Kaspersky Embedded Systems Security.

After you created a new policy, a set of allowing rules is created to prevent the applications from being blocked and to ensure their continuous operation. You can view the default rules in the task settings. Following are the details and limitations.

By default, Kaspersky Embedded Systems Security creates a set of rules for incoming network traffic when you create a new policy:

- Two allowing rules for Kaspersky Security Center Network Agent Windows Desktop Sharing process, located at %Program Files% and %Program Files (x86)%. Status: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.
- Two allowing rules for local port 15000. State: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.

By default, Kaspersky Embedded Systems Security creates a set of rules for outgoing network traffic when you create a new policy:

- Two allowing rules for Kaspersky Embedded Systems Security Service, located at %Program Files% and %Program Files (x86)%. Status: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.
- Two allowing rules for Kaspersky Embedded Systems Security workflow process, located at %Program Files% and %Program Files (x86)%. Status: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.
- Two allowing rules for local port 13000. State: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.

## Kaspersky Embedded Systems Security policy settings sections

### General

In the **General** section, you can configure the following policy settings:

- Indicate the policy status.
- Configure the inheritance settings for parent and child policies.

### Event notification

In the **Event notification** section, you can configure settings for the following event categories:

- *Critical events*
- *Functional failure*
- *Warning*
- *Informational message*

You can use the **Properties** button to configure the following settings for the selected events:

- Indicate the storage location and retention period for information about logged events.

- Indicate the notification method for logged events.

## Application settings

Settings of the Application Settings section

Section	Options
<b>Scalability, interface and scan settings</b>	<p>In the <b>Scalability, interface and scan settings</b> subsection, you can click the <b>Settings</b> button to configure the following settings:</p> <ul style="list-style-type: none"> <li>• Choose whether to configure scalability settings automatically or manually.</li> <li>• Configure the application icon display settings.</li> </ul>
<b>Security and reliability</b>	<p>In the <b>Security and reliability</b> subsection, you can click the <b>Settings</b> button to configure the following settings:</p> <ul style="list-style-type: none"> <li>• Configure the task run settings.</li> <li>• Specify how the application should behave when the protected device is running on UPS power.</li> <li>• Enable or disable password-protection of application functions.</li> </ul>
<b>Connections</b>	<p>In the <b>Connections</b> subsection, you can use the <b>Settings</b> button to configure the following proxy server settings for connecting with update servers, activation servers, and KSN:</p> <ul style="list-style-type: none"> <li>• Configure the proxy server settings.</li> <li>• Specify the proxy server authentication settings.</li> </ul>
<b>Run local system tasks</b>	<p>In the <b>Run local system tasks</b> subsection, you can use the <b>Settings</b> button to allow or block the start of the following local system tasks according to a schedule configured on protected devices:</p> <ul style="list-style-type: none"> <li>• On-Demand Scan task.</li> <li>• Update tasks and Copying Update task.</li> </ul>

## Supplementary

Settings of the Supplementary section

Section	Options
<b>Trusted Zone</b>	<p>Click the <b>Settings</b> button on the <b>Trusted Zone</b> subsection to configure the following Trusted Zone application settings:</p> <ul style="list-style-type: none"> <li>• Create a list of Trusted Zone exclusions.</li> <li>• Enable or disable scanning of file backup operations.</li> <li>• Create a list of trusted processes.</li> </ul>

<b>Removable Drives Scan</b>	In the <b>Removable Drives Scan</b> subsection, you can use the <b>Settings</b> button to configure scan settings for removable drives.
<b>User access permissions for application management</b>	In the <b>User access permissions for application management</b> subsection, you can configure user rights and user group rights to manage Kaspersky Embedded Systems Security.
<b>User access permissions for Kaspersky Security Service management</b>	In the <b>User access permissions for Kaspersky Security Service management</b> subsection, you can configure user rights and user group rights to manage the Kaspersky Security Service.
<b>Storages</b>	In the <b>Storages</b> subsection, click the <b>Settings</b> button to configure the following Quarantine, Backup and Blocked Hosts settings: <ul style="list-style-type: none"> <li>• Specify the path to the folder where you want to place Quarantine or Backup objects.</li> <li>• Configure the maximum size of Backup and Quarantine and also specify the free space threshold.</li> <li>• Specify the path to the folder where you want to place objects restored from Quarantine or Backup.</li> <li>• Configure how long hosts are blocked.</li> </ul>

## Real-Time Computer Protection

Settings of the Real-Time Computer Protection section

Section	Options
<b>Real-Time File Protection</b>	In the <b>Real-Time File Protection</b> subsection, you can click the <b>Settings</b> button to configure the following task settings: <ul style="list-style-type: none"> <li>• Indicate the protection mode.</li> <li>• Configure use of the Heuristic Analyzer.</li> <li>• Configure use of the Trusted Zone.</li> <li>• Indicate the protection scope.</li> <li>• Set the security level for the selected protection scope: you can select a predefined security level or configure the security settings manually.</li> <li>• Configure the task start settings.</li> </ul>
<b>KSN Usage</b>	In the <b>KSN Usage</b> subsection, you can click the <b>Settings</b> button to configure the following task settings: <ul style="list-style-type: none"> <li>• Indicate the actions to perform on KSN untrusted objects.</li> <li>• Configure data transfer and usage of Kaspersky Security Center as a KSN proxy server.</li> </ul> <p>Click the <b>Data processing</b> button to accept or reject the KSN Statement, and configure data exchange settings.</p>
<b>Exploit Prevention</b>	In the <b>Exploit Prevention</b> subsection, you can click the <b>Settings</b> button to configure the following task settings:

- Select the process memory protection mode.
- Indicate the actions to reduce exploit risks.
- Add to and edit the list of protected processes.

## Local activity control

Settings of the Local Activity Control section

Section	Options
<b>Applications Launch Control</b>	<p>In the <b>Applications Launch Control</b> subsection, you can use the <b>Settings</b> button to configure the following task settings:</p> <ul style="list-style-type: none"> <li>• Select the task operating mode.</li> <li>• Configure settings for controlling subsequent application launches.</li> <li>• Indicate the scope of the Applications Launch Control rules.</li> <li>• Configure use of KSN.</li> <li>• Configure the task start settings.</li> </ul>
<b>Device Control</b>	<p>In the <b>Device Control</b> subsection, you can click the <b>Settings</b> button to configure the following task settings:</p> <ul style="list-style-type: none"> <li>• Select the task operating mode.</li> <li>• Configure the task start settings.</li> </ul>

## Network activity control

Settings of the Network activity control section

Section	Options
<b>Firewall Management</b>	<p>In the <b>Firewall Management</b> subsection, you can click the <b>Settings</b> button to configure the following task settings:</p> <ul style="list-style-type: none"> <li>• Configure firewall rules.</li> <li>• Configure the task start settings.</li> </ul>

## System inspection

Settings of the System Inspection section

Section	Options
<b>File Integrity Monitor</b>	<p>In the <b>File Integrity Monitor</b> subsection, you can configure control over changes in files that can signify a security breach on a protected device.</p>

<b>Log Inspection</b>	In the <b>Log Inspection</b> section, you can configure protected device integrity monitoring based on the results of an analysis of the Windows Event Log.
-----------------------	---

## Logs and notifications

Settings of the Logs and Notifications section

Section	Options
<b>Task logs</b>	<p>In the <b>Task logs</b> subsection, you can click the <b>Settings</b> button to configure the following settings:</p> <ul style="list-style-type: none"> <li>• Specify the importance level of the logged events for the selected software components.</li> <li>• Specify the task log storage settings.</li> <li>• Specify the SIEM integration with Kaspersky Security Center settings.</li> </ul>
<b>Event notifications</b>	<p>In the <b>Event notifications</b> subsection, you can click the <b>Settings</b> button to configure the following settings:</p> <ul style="list-style-type: none"> <li>• Specify the user notification settings for the <i>Object detected</i>, <i>Untrusted external device detected and restricted</i>, and <i>Network session listed as untrusted</i> events.</li> <li>• Specify the administrator notification settings for any event selected in the event list in the <b>Notification settings</b> section.</li> </ul>
<b>Interaction with Administration Server</b>	<p>In the <b>Interaction with Administration Server</b> section, you can click the <b>Settings</b> button to select the types of objects (including Quarantine and Backup objects) that Kaspersky Embedded Systems Security will report to Administration Server.</p>

## Malfunction diagnosis

Settings of the Malfunction diagnosis section

Section	Options
<b>Troubleshooting settings</b>	<p>In the <b>Troubleshooting settings</b> subsection, you can configure the following options:</p> <ul style="list-style-type: none"> <li>• Select the option to <b>Enable tracing</b>.</li> <li>• Define the <b>Folder for trace files</b>.</li> <li>• Specify the <b>Level of details</b>.</li> <li>• Define the <b>Maximum size of the trace files</b>.</li> <li>• Select the option to <b>Remove the oldest trace files</b>.</li> <li>• Define the <b>Maximum number of files for one trace log</b>. Group policy settings and local settings introduce matching parameters. To learn more about the options and its limitations, see the <a href="#">local settings</a> configuration. You can set different values for the parameters on the local device and in the group policy for multiple devices, with the following conditions applied.</li> </ul>

	<ul style="list-style-type: none"> <li>• Group policy settings configured on Kaspersky Security Center server are of higher priority over the local settings.</li> <li>• Group policy settings configured on the local device are of lower priority over the local settings.</li> </ul>
<b>Dump file settings</b>	<p>In the <b>Dump file settings</b> subsection, you can configure the following options as applicable:</p> <ul style="list-style-type: none"> <li>• Select the option to <b>Create the dump file</b>.</li> <li>• Define the <b>Dump file folder</b>. Group policy settings and local settings introduce matching parameters. To learn more about the options and its limitations, see the <a href="#">local settings</a> configuration. You can set different values for the parameters on the local device and in the group policy for multiple devices, with the following conditions applied.</li> <li>• Group policy settings configured on Kaspersky Security Center server are of higher priority over the local settings.</li> <li>• Group policy settings configured on the local device are of lower priority over the local settings.</li> </ul>

## Revision history

In the **Revision history** section, you can manage revisions: compare with the current revision or other policy, add descriptions of revisions, save revisions to a file or perform a rollback.

## Configuring a policy

In the **Properties: <Policy name>** window of an existing policy, you can configure:

- General Kaspersky Embedded Systems Security settings.
- Quarantine and Backup settings.
- Trusted Zone, Real-Time Computer Protection, and Local Activity Control settings.
- Level of detail for task logs.
- User and administrator notifications about Kaspersky Embedded Systems Security events.
- Access privileges for managing the application and the Kaspersky Security Service.

*To configure the policy settings:*

1. Expand the **Managed devices** node in the tree of the Administration Console of Kaspersky Security Center.
2. Expand the administration group for which you want to configure the associated policy settings, and open the **Policies** tab in the details pane.

3. Select the policy you want to configure and open the **Properties: <Policy name>** window using one of the following methods:
  - Selecting the **Properties** option in the policy context menu.
  - Clicking the **Configure policy** link in the right details pane of the selected policy.
  - Double-clicking the selected policy.
4. On the **General** tab in the **Policy status** section, enable or disable the policy. To do so, select one of the options below:
  - **Active policy**, if you want the policy to be applied on all protected devices within the selected administration group.
  - **Inactive policy**, if you want to activate the policy later on all protected devices within the selected administration group.

The **Out-of-office policy** setting is not available when you manage Kaspersky Embedded Systems Security.

5. In the **Event configuration**, **Application settings**, **Supplementary**, **Logs and notifications**, and **Revision history** sections, you can modify the application configuration (see table below).
6. In the **Real-Time Computer Protection**, **Local activity control**, **Network activity control**, and **System inspection** sections, configure the application settings and application launch settings (see the table below).

You can enable or disable the execution of any task on all protected devices within the administration group by means of a Kaspersky Security Center policy.

You can configure the application of policy settings on all network protected devices for each individual software component.

7. Click **OK**.

The configured settings are applied in the policy.

## Creating and configuring tasks using Kaspersky Security Center

This section contains information about Kaspersky Embedded Systems Security tasks, and how to create them, configure task settings, and start and stop them.

### About task creation in Kaspersky Security Center

You can create group tasks for administration groups and sets of protected devices. You can create the following types of tasks via Kaspersky Security Center:

- Activation of the Application

- Copying Updates
- Database Update
- Software Modules Update
- Rollback of Database Update
- On-Demand Scan
- Application Integrity Control
- Baseline File Integrity Monitor
- Rule Generator for Applications Launch Control
- Rule Generator for Device Control

You can create local and group tasks in the following ways:

- For one protected device: in the **Properties <Protected device name>** window in the **Tasks** section.
- For an administration group: in the results pane of the node of the selected group of protected devices on the **Tasks** tab.
- For a set of protected devices: in the results pane of the **Device selections** node.

You can use policies to disable [schedules for update and On-Demand Scan local system tasks](#) on all protected devices in the same administration group.

General information on tasks in Kaspersky Security Center is provided in *Kaspersky Security Center Help*.

## Creating a task using Kaspersky Security Center

*To create a new task in the Kaspersky Security Center Administration Console:*

1. Start the task wizard in one of the following ways:

- To create a local task:
  - a. Expand the **Managed devices** node in the Administration Console tree and select the group that the protected device belongs to.
  - b. In the results pane of the **Devices** tab, open the context menu of the protected device and select **Properties**.
  - c. In the window that opens, click the **Add** button in the **Tasks** section.
- To create a group task:
  - a. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
  - b. Select the administration group for which you want to create a task.

c. In the results pane, open the **Tasks** tab and select **Create a task**.

- To create a task for a custom set of protected devices:
  - a. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
  - b. Select the administration group containing the protected devices.
  - c. Select a protected device or a custom set of protected devices.
  - d. From the **Perform action** drop-down list, select the **Create a task** option.

The task wizard window opens.

2. In the **Select the task type** window, under the heading **Kaspersky Embedded Systems Security 3.2**, select the type of the task to be created.

3. If you selected any task type except Rollback of Database Update, Application Integrity Control or Activation of the Application, the **Settings** window opens. Depending on the task type, the settings may vary:

- [Create an On-Demand Scan task](#).
- To create an update task, configure task settings based on your requirements:
  - a. Select an update source in the **Update source** window.
  - b. Click the **Connection settings** button. In the **Connection settings** window, configure proxy server access settings when connecting to the update source.
- To create a Software Modules Update task, configure the required application module update settings in the **Settings for application software module updates** window:
  - a. Select whether to copy and install critical software module updates, or only to check for their availability without installation.
  - b. If **Copy and install critical software modules updates** is selected: a protected device restart may be required to apply the installed software modules. If you wish Kaspersky Embedded Systems Security to restart the protected device automatically upon task completion, select the **Allow operating system restart** check box.
  - c. To obtain information about Kaspersky Embedded Systems Security module upgrades, select **Receive information about available scheduled software modules updates**.

Kaspersky does not publish planned update packages on the update servers for automatic installation; these can be downloaded manually from the Kaspersky website. An administrator notification about the **New scheduled software modules update is available** event can be configured. This will contain the URL of our website from which scheduled updates can be downloaded.
- To create the Copying Updates task, specify the set of updates and the destination folder in the **Copying updates settings** window.
- To create the Activation of the Application task:
  - a. In the **Activation Settings** window, specify the key file that you want to use to activate the application.
  - b. Select the **Use as additional key** check box if you want to create a task for renewing the license.

- [Create the Rule Generator for Applications Launch Control task.](#)
- [Create the Rule Generator for Device Control task.](#)

#### 4. [Configure the task schedule.](#)

You can configure a schedule for all task types except the Rollback of Database Update task.

5. Click **OK**.

6. If the task is being created for a set of protected devices, select the network (or group) of protected devices on which this task will be executed.

7. In the **Selecting an account to run the task** window, specify the account you want to use to run the task.

8. In the **Define the task name** window, enter the task name (no longer than 100 characters) not containing the symbols " \* < > ? \ | : .

We recommend that you add the task type to the task name (for example, "On-demand scan of shared folders").

9. In the **Finishing creating the task** window:

- Select the **Run task after Wizard finishes** check box if you want the task to start as soon as it is created.
- Click **Finish**.

The task created is displayed in the **Tasks** list.

## Configuring local tasks in the Application settings window of the Kaspersky Security Center

*To configure local tasks or general application settings for a single network protected device:*

- Expand the **Managed devices** node in the tree of the Administration Server of Kaspersky Security Center and select the group that the protected device belongs to.
- In the results pane, select the **Devices** tab.
- Open the **Properties: <Protected device name>** window in one of the following ways:
  - Double-click the name of the protected device.
  - Open the context menu of the protected device name and select the **Properties** item.

The **Properties: <Protected device name>** window opens.

4. To configure local task settings, perform the following steps:

- Go to the **Tasks** section.
- In the task list, select a local task to configure:
  - Double-click the task name in the list of tasks.

- Select the task name and click the **Properties** button.
- Select **Properties** in the context menu of the selected task.

The **Properties: <Task name>** window opens.

5. To configure application settings, perform the following steps:

a. Go to the **Applications** section.

b. In the installed applications list, select an application to configure:

- Double-click the application name in the list of installed applications.
- Select the application name in the list of installed applications and click the **Properties** button.
- Open the context menu of the application name in the list of installed applications and select the **Properties** item.

The **<Application name> settings** window opens.

If the application is currently under the Kaspersky Security Center policy and this policy prohibits changing the application settings, you cannot edit these settings via the **<Application name> settings** window.

## Configuring group tasks in Kaspersky Security Center

When managing Kaspersky Embedded Systems Security from Kaspersky Security Center Cloud Console, you cannot add custom HTTP and FTP servers or network folders manually.

*To configure a group task for multiple protected devices:*

1. In the Kaspersky Security Center Administration Console tree, expand the **Managed devices** node and select the administration group for which you want to configure the application tasks.
2. In the details pane of a selected administration group, open the **Tasks** tab.
3. In the list of previously created group tasks, select a task you want to configure.
4. Open the **Properties: <Task name>** window in one of the following ways:
  - Double-click the name of the task in the list of created tasks.
  - Select the name of the task in the list of created tasks and click the **Configure task** link.
  - Open the context menu of the task name in the list of created tasks and select the **Properties** item.

In the **Notification** section, configure the task event notification settings. For detailed information on how to configure settings in this section, see *Kaspersky Security Center Help*.

5. Depending on the type of configured task, do one of the following actions:

- To configure an On-Demand Scan task:
  - In the **Scan scope** section, configure a scan scope.
  - In the **Options** section, configure the task priority level and integration with other software components.
- To configure an update task, adjust the task settings based on your requirements:
  - In the **Settings** section, configure update source settings and disk subsystem optimization.
  - Click the **Connection settings** button to configure update source connection settings.
- To configure the Software Modules Update task:
  - Go to the **Settings for application software module updates** section.
  - Choose an action to perform: copy and install critical updates of software modules or only check for them.
- To configure the Copying Updates task, specify the set of updates and the destination folder in the **Copying updates settings** section.
- To configure the Activation of the Application task:
  - In the **Activation Settings** section, apply the key file that you want to use to activate the application.
  - Select the **Use as additional key** check box if you want to add an activation code or key file for renewing the license.
- To configure the automatic generation of allowing rules for Device Control, in the **Settings** section, specify the settings that will be used to create the list of allowing rules.

6. Configure the task schedule in the **Schedule** section. You can schedule all task types except Rollback of Database Update.

7. In the **Account** section, specify the account whose rights will be used to run the task. For detailed information regarding configuring settings in this section, see the *Kaspersky Security Center Help*.

8. If required, specify the objects to exclude from the task scope in the **Exclusions from task scope** section. For detailed information regarding configuring settings in this section, see *Kaspersky Security Center Help*.

9. In the **Properties: <Task name>** window, click **OK**.

The newly configured group task settings are saved.

Configurable group task settings are summarized in the table below.

Kaspersky Embedded Systems Security group tasks settings

Kaspersky Embedded Systems Security task types	Section in the Properties: <Task name> window	Task settings
<a href="#">Rule</a>	<b>Settings</b>	While configuring the Rule Generator for Applications Launch Control task

<a href="#">Generator for Applications Launch Control</a>		<p>settings you can select how to create allowing rules:</p> <ul style="list-style-type: none"> <li>• <a href="#">Create allowing rules based on running applications</a> </li> <li>• <a href="#">Create allowing rules for applications from the folders</a> </li> </ul>
	<p><b>Options</b></p>	<p>You can specify actions to perform while creating allowing rules for applications launch control:</p> <ul style="list-style-type: none"> <li>• <b>Use digital certificate</b></li> <li>• <b>Use digital certificate subject and thumbprint</b></li> <li>• <b>If the certificate is missing, use</b></li> <li>• <b>Use SHA256 hash</b></li> <li>• <b>Generate rules for user or group of users</b></li> </ul> <p>You can configure settings for configuration files with allowing rule lists that Kaspersky Embedded Systems Security creates upon task completion.</p>
	<p><b>Schedule</b></p>	<p>You can configure settings to schedule a task.</p>
<a href="#">Rule Generator for Device Control</a>	<p><b>Settings</b></p>	<ul style="list-style-type: none"> <li>• Select the operation mode: consider system data on all external devices that have ever been connected or only consider currently connected external devices.</li> <li>• Configure settings for configuration files with allowing rule lists that Kaspersky Embedded Systems Security creates upon task completion.</li> </ul>
	<p><b>Schedule</b></p>	<p>You can configure settings to start the task on a schedule.</p>
<a href="#">Activation of the Application</a>	<p><b>Activation Settings</b></p>	<p>To activate the application or to renew the license, you can add a key file.</p>

	<p><b>Schedule</b></p>	<p>You can configure settings to start the task on a schedule.</p>
<a href="#">Database Update</a>	<p><b>Settings</b></p>	<p>You can specify Kaspersky Security Center Administration Server or Kaspersky update servers as an application update source in the <b>Update source</b> group box. You can also create a customized list of update sources:</p>

		<p>by adding custom HTTP and FTP servers or network folders manually and setting them as update sources.</p> <p>You can specify usage of Kaspersky update servers if manually customized servers are not available.</p> <p>In the Disk I/O usage optimization section you can configure the feature that reduces the workload on the disk subsystem:</p> <ul style="list-style-type: none"> <li>• <b>Lower the load on the disk I/O</b></li> <li>• <b>RAM used for optimization (MB)</b></li> </ul>
	<b>Connection settings window</b>	In the <b>Connection settings</b> window linked from the <b>Update source</b> section, you can specify whether a proxy server should be used to establish the connection to Kaspersky update servers or any other server.
	<b>Schedule</b>	You can configure settings to start the task on a schedule.
<a href="#">Software Modules Update</a>	<b>Update source</b>	<p>You can specify Kaspersky Security Center Administration Server or Kaspersky update servers as an application update source. You can also create a customized list of update sources: by adding custom HTTP and FTP servers or network folders manually and setting them as update sources.</p> <p>You can specify the usage of Kaspersky update servers, if manually customized servers are not available.</p>
	<b>Connection settings window</b>	In the <b>Update source connection settings</b> group box, you can specify whether a proxy server should be used to establish the connection to Kaspersky update servers or any other server.
	<b>Settings for application software module updates</b>	You can specify which actions Kaspersky Embedded Systems Security should perform when critical software module updates are available or have already been installed, and also whether Kaspersky Embedded Systems Security should receive information regarding scheduled updates.
	<b>Schedule</b>	You can configure settings to start the task on a schedule.
<a href="#">On-Demand Scan Settings</a>	<b>Scan scope</b>	You can specify a scan scope for the On-Demand Scan task and configure security level settings.
	<b>On-demand scan settings window</b>	In the <b>On-demand scan settings</b> window linked from the <b>Scan scope</b> section, you can select one of the predefined security levels or customize a security level manually.
	<b>Options</b>	<p>You can activate or deactivate use of the heuristic analyzer for the On-Demand Scan task and set the analysis level using a slider in the <b>Heuristic analyzer</b> group box.</p> <p>In the <b>Integration with other components</b> group box, you can configure the following settings:</p> <ul style="list-style-type: none"> <li>• Apply Trusted Zone for On-Demand Scan tasks.</li> <li>• Apply KSN usage for On-Demand Scan tasks.</li> <li>• Set a priority for the On-Demand Scan task: perform task in background mode (low priority) or consider task a Critical Areas Scan.</li> </ul>

	<b>Schedule</b>	You can configure settings to start the task on a schedule.
<a href="#">Application Integrity Control</a>	<b>Schedule</b>	You can configure settings to start the task on a schedule.
<a href="#">Baseline File Integrity Monitor</a>	<b>Schedule</b>	You can configure settings to start the task on a schedule.

For the Rollback of Database Update task, you can configure only the standard task settings controlled by Kaspersky Security Center in the **Notification** and **Exclusions from task scope** sections.

For detailed information on configuring settings in these sections, see *Kaspersky Security Center Help*.

## Activation of the Application task

*To configure an Activation of the Application task:*

1. In the Kaspersky Security Center Administration Console tree, expand the **Managed devices** node and select the administration group for which you want to configure the application tasks.
2. In the details pane of a selected administration group, open the **Tasks** tab.
3. In the list of previously created group tasks, select a task you want to configure.
4. Open the **Properties: <Task name>** window in one of the following ways:
  - Double-click the name of the task in the list of created tasks.
  - Select the name of the task in the list of created tasks and click the **Configure task** link.
  - Open the context menu of the task name in the list of created tasks and select the **Properties** item.

In the **Notification** section, configure the task event notification settings. For detailed information on how to configure settings in this section, see *Kaspersky Security Center Help*.

5. In the **Activation Settings** section, specify the key file that you want to use to activate the application. Select the **Use as additional key** check box if you want to add a key to extend the license.
6. Configure the task schedule in the **Schedule** section (you can configure a schedule for all task types except Rollback of Database Update).
7. In the **Account** section, specify the account whose rights will be used to run the task.
8. If required, specify the objects to exclude from the task scope in the **Exclusions from task scope** section.

For detailed information on configuring settings in these sections, see *Kaspersky Security Center Help*.

9. In the **Properties: <Task name>** window, click **OK**.

The newly configured group task settings are saved.

## Update tasks

To configure the *Copying Updates*, *Database Update*, or *Software Modules Update* tasks:

1. In the Kaspersky Security Center Administration Console tree, expand the **Managed devices** node and select the administration group for which you want to configure the application tasks.
2. In the details pane of a selected administration group, open the **Tasks** tab.
3. In the list of previously created group tasks, select a task you want to configure.
4. Open the **Properties: <Task name>** window in one of the following ways:
  - Double-click the name of the task in the list of created tasks.
  - Select the name of the task in the list of created tasks and click the **Configure task** link.
  - Open the context menu of the task name in the list of created tasks and select the **Properties** item.

In the **Notification** section, configure the task event notification settings. For detailed information on how to configure settings in this section, see *Kaspersky Security Center Help*.

5. In the **Update source** section, do the following:
  - a. Select the update source:
    - Kaspersky Security Center Administration Server.
    - Kaspersky update servers.
    - Custom HTTP or FTP servers, or network folders.

To use an SMB-shared folder as an update source, you need to [specify a user account to start a task](#).

You can specify the usage of Kaspersky update servers if manually customized servers are not available.

- b. Click the **Connection settings** button.
- c. In the **Connection settings** window that opens, configure the use of a proxy server for connecting to Kaspersky update servers and other servers.
- d. For the Database Update task, in the **Disk I/O usage optimization** section, configure the feature that reduces the workload on the disk subsystem:

The **Disk I/O usage optimization** section is available only for the Database Update task.

- [Lower the load on the disk I/O](#)

- [RAM used for optimization \(MB\)](#) <sup>?</sup>

6. For the Software Modules Update task, in the **Settings for application software module updates** section, specify which actions Kaspersky Embedded Systems Security should perform when critical software module updates are available or information about planned updates is available.

You can also specify which actions Kaspersky Embedded Systems Security should perform when critical updates are installed.

The **Settings for application software module updates** section is available only for the Software Modules Update task.

7. For the Copying Updates task, in the **Copying updates settings** section, specify the set of updates and the destination folder.

The **Copying updates settings** section is available only for the Copying Updates task.

8. Configure the task schedule in the **Schedule** section (you can configure a schedule for all task types except Rollback of Database Update).

9. In the **Account** section, specify the account whose rights will be used to run the task.

For detailed information on configuring settings in these sections, see *Kaspersky Security Center Help*.

10. In the **Properties: <Task name>** window, click **OK**.

The newly configured group task settings are saved.

For the Rollback of Database Update task, you can configure only the standard task settings controlled by Kaspersky Security Center in the **Notifications** and **Exclusions from task scope** sections. For detailed information on configuring settings in these sections, see *Kaspersky Security Center Help*.

## Application Integrity Control

*To configure the Application Integrity Control group task:*

1. In the Kaspersky Security Center Administration Console tree, expand the **Managed devices** node and select the administration group for which you want to configure the application tasks.
2. In the details pane of a selected administration group, open the **Tasks** tab.
3. In the list of previously created group tasks, select a task you want to configure.
4. Open the **Properties: <Task name>** window in one of the following ways:
  - Double-click the name of the task in the list of created tasks.
  - Select the name of the task in the list of created tasks and click the **Configure task** link.
  - Open the context menu of the task name in the list of created tasks and select the **Properties** item.

In the **Notification** section, configure the task event notification settings. For detailed information on how to configure settings in this section, see *Kaspersky Security Center Help*.

5. In the **Devices** section, select the devices for which you want to configure the Application Integrity Control task.
6. Configure the task schedule in the **Schedule** section (you can configure a schedule for all task types except Rollback of Database Update).
7. In the **Account** section, specify the account whose rights will be used to run the task.
8. If required, specify the objects to exclude from the task scope in the **Exclusions from task scope** section.

For detailed information on configuring settings in these sections, see *Kaspersky Security Center Help*.

9. In the **Properties: <Task name>** window, click **OK**.

The newly configured group task settings are saved.

## Configuring Malfunction diagnosis settings in Kaspersky Security Center

If a problem occurs when operating Kaspersky Embedded Systems Security (for example, the application crashes), you can diagnose it. To do so, you can enable the creation of trace files and a dump file for the Kaspersky Embedded Systems Security process and send these files for analysis to Kaspersky Technical Support.

Kaspersky Embedded Systems Security does not send any trace or dump files automatically. Diagnostic data can only be sent by a user who has the required permissions.

Kaspersky Embedded Systems Security writes information to trace files and the dump file in unencrypted form. The folder where files are saved is selected by the user and managed by the operating system configuration and Kaspersky Embedded Systems Security settings. You can configure access permissions and allow only required users to access logs, trace files and dump files.

*To configure the Malfunction diagnosis settings in Kaspersky Security Center:*

1. In the Kaspersky Security Center Administration Console, open the [Application settings](#) window.
2. Open the **Malfunction diagnosis** section.
3. If you want the application to write debug information to a file, in the **Troubleshooting settings** subsection, select the **Enable tracing** check box.
4. In the **Trace files folder** field, specify the absolute path to a local folder where Kaspersky Embedded Systems Security will save trace files.  
The folder must be created beforehand and must be available for writing for SYSTEM account. You cannot specify a network folder, a drive, and environment variables.
5. Configure [the level of details of debug information](#).

6. Specify the **Maximum size of a trace file (MB)**.

Available values: from 1 to 4095 MB. By default, the maximum size of trace files is set to 50 MB.

7. If you want the application to remove the oldest files after the maximum number of trace files is reached, select the **Remove the oldest trace files** check box.

8. Specify the **Maximum number of files for one trace log**.

Available values: from 1 to 999. By default, the maximum number of files is set to 5. The field is available only if the **Remove the oldest trace files** check box is selected.

9. If you want the application to create a dump file, select the **Create dump file** check box.

10. In the **Dump files folder** field, specify the absolute path to a local folder where Kaspersky Embedded Systems Security will save the dump file.

The folder must be created beforehand and must be available for writing for SYSTEM account. You cannot specify a network folder, a drive, and environment variables.

11. Click **OK**.

The configured application settings are applied on the protected device.

## Managing task schedules

You can schedule Kaspersky Embedded Systems Security tasks.

## Scheduling tasks

You can schedule local system and custom tasks in the Application Console. You cannot schedule group tasks in the Application Console.

*To schedule group tasks using the Administration Plug-in:*

1. In the Kaspersky Security Center Administration Console tree, expand the **Managed devices** node.
2. Select the group that the protected device belongs to.
3. In the results pane, select the **Tasks** tab.
4. Open the **Properties: <Task name>** window in one of the following ways:
  - Double-click the name of the task.
  - Open the context menu of the task name and select the Properties item.
5. Select the **Schedule** section.
6. In the **Schedule settings** block, select the **Run by schedule** check box.

Fields with schedule settings for the On-Demand Scan and Update tasks are unavailable if scheduling of these tasks is blocked by a Kaspersky Security Center policy.

7. Configure schedule settings in accordance with your requirements. To do this, perform the following actions:

a. In the **Frequency** list, select one of the following values:

- **Hourly**, if you want the task to run at intervals of a specified number of hours; specify the number of hours in the **Every <number> hour(s)** field.
- **Daily**, if you want the task to run at intervals of a specified number of days; specify the number of days in the **Every <number> day(s)** field.
- **Weekly**, if you want the task to run at intervals of a specified number of weeks; specify the number of weeks in the **Every <number> week(s)** field. Specify the days of the week to start the task (by default tasks run on Mondays).
- **At application launch**, if you want the task to run every time Kaspersky Embedded Systems Security starts.
- **After application database update**, if you want the task to run after every update of the application databases.

b. Specify the time for the first task start in the **Start time** field.

c. In the **Start date** field, specify the date when the schedule starts.

After you have scheduled the start time, date and frequency of the task, the estimated time for the next start is displayed.

Go to the **Schedule** tab and open the **Task settings** window. In the **Next start** field in the top of the window, the estimated start time is displayed. Each time you open the window, this estimated start time is updated and displayed.

The **Next start** field displays the **Blocked by policy** value if Kaspersky Security Center policy settings prohibit [scheduled local system tasks](#) from starting.

8. Use the **Advanced** tab to configure the following schedule settings in accordance with your requirements.

- In the **Task stop settings** section:
  - a. Select the **Duration** check box and, in the fields to the right, enter the maximum number of hours and minutes of task execution.
  - b. Select the **Pause from** check box and, in the fields to the right, enter the start and end values of a time interval under 24 hours during which task execution will be paused.
- In the **Advanced settings** section:
  - a. Select the **Cancel schedule from** check box and specify the date from which the schedule will cease to apply.

b. Select the **Run skipped tasks** check box to enable the start of skipped tasks.

c. Select the **Randomize the task start time within the interval of** check box and specify a value in minutes.

9. Click **OK**.

10. Click the **Apply** button to save the task start settings.

If you want to configure application settings for a single task using Kaspersky Security Center, see section "[Configuring local tasks in the Application settings window of the Kaspersky Security Center](#)".

## Enabling and disabling scheduled tasks

You can enable and disable scheduled tasks either before or after configuring the schedule settings.

*To enable or disable the task start schedule:*

1. In the Kaspersky Security Center Administration Console tree, expand the **Managed devices** node.
2. Select the group that the protected device belongs to.
3. In the results pane, select the **Tasks** tab.
4. Open the **Properties: <Task name>** window in one of the following ways:
  - Double-click the name of the task.
  - Open the context menu of the task name and select the Properties item.
5. Select the **Schedule** section.
6. Do one of the following:
  - Select the **Run by schedule** check box if you want to enable scheduled task start.
  - Clear the **Run by schedule** check box if you want to disable scheduled task start.

The configured task start schedule settings are not deleted and will be applied at the next scheduled start of the task.

7. Click **OK**.

8. Click **Apply**.

The configured task start schedule settings are saved.

## Reports in Kaspersky Security Center

Reports in Kaspersky Security Center contain information about the status of managed devices. Reports are based on information stored on Administration Server.

Starting from Kaspersky Security Center 11, the following types of reports are available for Kaspersky Embedded Systems Security:

- Report on the status of application components
- Report on prohibited applications
- Report on prohibited applications in test mode

See *Kaspersky Security Center Help* for detailed information about all Kaspersky Security Center reports and how to configure them.

## Report on the status of Kaspersky Embedded Systems Security components

You can monitor the protection status of all network devices and get a structured overview of the set of components on each device.

The report displays one of the following states for each component: *Running*, *Paused*, *Stopped*, *Malfunction*, *Not installed*, *Starting*.

The *Not Installed* status refers to the component, not the application itself. If the application is not installed, Kaspersky Security Center assigns the N/A (Not available) status.

You can create component selections and use filtering to display network devices with a specified set of components and state.

See *Kaspersky Security Center Help* for detailed information about creating and using selections.

*To review the component statuses in the application settings:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree and select the administration group for which you want to configure application settings.
2. Select the **Devices** tab and open the [Application settings window](#).
3. Select the **Components** section.
4. Review the status table.

*To review a Kaspersky Security Center standard report:*

1. Select the **Administration Server <Administration Server name>** node in the Administration Console tree.
2. Open the **Reports** tab.
3. Double-click the **Report on the status of application components** list item.  
A report is generated.

4. Review the following report details:

- Graphical diagram.
- Summary table of components and aggregated numbers of network devices where each of the components is installed, and groups they belong to.
- Detailed table specifying the component status, version, device and group.

## Reports on prohibited applications in active and test modes

Based on the results of the Applications Launch Control task, two types of reports can be generated: a report on prohibited applications (if the task is started in Active mode) and a report on prohibited applications in test mode (if the task is started in Statistics only mode). These reports display information about blocked applications on the protected devices of the network. Each report is generated for all administration groups and accumulates data from all the Kaspersky applications installed on the protected devices.

*To review a report on prohibited applications in Statistics only mode:*

1. Start the Applications Launch Control task in [Statistics only mode](#).
  2. Select the **Administration Server <Administration Server name>** node in the Administration Console tree.
  3. Open the **Reports** tab.
  4. Double-click the **Report on prohibited applications in test mode** item.  
A report is generated.
5. Review the following report details:

- A graphical diagram that displays the top 10 applications with the largest number of blocked starts.
- A summary table of application blocks, specifying the executable file name, reason, time of blocking, and number of devices where the blocking occurred.
- A detailed table specifying data about the device, file path and criteria for blocking.

*To review a report on prohibited applications in Active mode:*

1. Start the Applications Launch Control task in [Active mode](#).
2. Select the **Administration Server <Administration Server name>** node in the Administration Console tree.
3. Open the **Reports** tab.
4. Double-click the **Report on prohibited applications** item.  
A report is generated.

This report consists of the same data about blocks as the report on prohibited applications in test mode.

# Working with the Kaspersky Embedded Systems Security Console

This section provides information about the Kaspersky Embedded Systems Security Console and describes how to manage the application using the Application Console installed on the protected device or another device.

## About the Kaspersky Embedded Systems Security Console

Kaspersky Embedded Systems Security Console is an isolated snap-in that you can add to the Microsoft Management Console.

You can manage the application via the Application Console installed on the protected device or on another device on the corporate network.

After the Application Console has been installed on another device, advanced configuration is required.

You can install the Application Console and Kaspersky Embedded Systems Security on different protected devices assigned to different domains. In this case, there may be limitations on sending information from the application to the Application Console. For example, after any application task starts, its status may remain unchanged in the Application Console.

When installing the Application Console, the installation wizard creates the kavfs.msc file in the installation folder and adds Kaspersky Embedded Systems Security snap-in to the list of isolated Microsoft Windows snap-ins.

You can start the Application Console from the **Start** menu. The Kaspersky Embedded Systems Security snap-in msc-file can be run or added to the Microsoft Management Console as a new element in the tree.

Under a 64-bit version of Microsoft Windows, the Kaspersky Embedded Systems Security snap-in can be added only in the 32-bit version of Microsoft Management Console. To add the Kaspersky Embedded Systems Security snap-in, open Microsoft Management Console from the command line by executing the command: `mmc.exe /32`.

Multiple Kaspersky Embedded Systems Security snap-ins can be added to one Microsoft Management Console opened in author mode. You can then manage the protection of multiple devices on which Kaspersky Embedded Systems Security is installed.

## Kaspersky Embedded Systems Security Console interface

This section describes the primary elements of the application interface.

## Kaspersky Embedded Systems Security Console window

The Kaspersky Embedded Systems Security Console is displayed in the Microsoft Management Console tree in the form of a node.

After a connection has been established to Kaspersky Embedded Systems Security installed on a different protected device, the name of the node is supplemented with the name of the protected device on which the application is installed and the name of the user account under which the connection has been established: **Kaspersky Embedded Systems Security <Protected device name> as <account name>**. Upon connection to Kaspersky Embedded Systems Security installed on the same protected device with the Application Console, the node name is **Kaspersky Embedded Systems Security**.

## The Application Console tree

The Application Console tree displays the **Kaspersky Embedded Systems Security** node and the child nodes of functional components of the application.

The **Kaspersky Embedded Systems Security** node includes the following child nodes:

- **Real-Time Computer Protection**: manages the Real-Time Computer Protection tasks and KSN services. The **Real-Time Computer Protection** node allows to configure the following tasks:
  - **Real-Time File Protection**
  - **KSN Usage**
  - **Exploit Prevention**
- **Computer Control**: controls launches of applications installed on a protected device, as well as external devices connections. The **Computer Control** node allows to configure the following tasks:
  - **Applications Launch Control**
  - **Device Control**
  - **Firewall Management**
- **Automated rule generators**: configuring automatic generation of group and system rules for the Applications Launch Control task and the Device Control task.
  - **Rule Generator for Applications Launch Control**
  - **Rule Generator for Device Control**
  - Rule generation group tasks **<Task names>** (if any)  
[Group tasks](#) are created using Kaspersky Security Center. You cannot manage group tasks through the Application Console.
- **System Inspection**: configuring file operations control and Windows Event Log inspection settings.
  - **File Integrity Monitor**
  - **Log Inspection**
- **On-Demand Scan**: manage On-Demand Scan tasks. There is a separate node for each task:
  - **Scan at Operating System Startup**
  - **Critical Areas Scan**

- Quarantine Scan
- Application Integrity Control
- Custom tasks <Task names> (if any)

The node displays [system tasks](#) created when the application is installed, custom tasks, and group on-demand scan tasks created and sent to a protected device using Kaspersky Security Center.

- **Update:** manage updates for Kaspersky Embedded Systems Security databases and modules and copies the update to a local update source folder. The node contains child nodes for administering each update task and the last **Rollback of Application Database Update** task:
  - Database Update
  - Software Modules Update
  - Copying Updates
  - Rollback of Application Database Update

The node displays all [custom and group update tasks](#) created and sent to a protected device using Kaspersky Security Center.

- **Storages:** Management of Quarantine and Backup settings.
  - Quarantine
  - Backup
- **Logs and notifications:** manages local task logs, Security log and Kaspersky Embedded Systems Security System audit log.
  - Security log
  - System audit log
  - Task logs
- **Licensing:** add or delete Kaspersky Embedded Systems Security license keys, view license details.

## Details pane

The details pane displays information about the selected node. If the **Kaspersky Embedded Systems Security** node is selected, the details pane displays information about the current device [protection status](#) and information about Kaspersky Embedded Systems Security, the protection status of its functional components, and the license expiration date.

## Context menu of the Kaspersky Embedded Systems Security node

You can use the items of the context menu of the **Kaspersky Embedded Systems Security** node to perform the following operations:

- **Connect to another computer.** [Connect to another device](#) to manage Kaspersky Embedded Systems Security installed on it. You can also perform this operation by clicking the link in the lower right corner of the details pane of the **Kaspersky Embedded Systems Security** node.
- **Start the service / Stop the service.** [Start or stop application or a selected task](#). To carry out these operations, you can also use the buttons on the toolbar. You can also perform these operations in context menus of application tasks.
- **Configure removable drives scan settings.** Configure [scanning of removable drives](#) connected to the protected device via the USB port.
- **Configure Trusted Zone settings.** View and configure [Trusted Zone settings](#).
- **Modify user rights of application management.** View and configure permissions to access Kaspersky Embedded Systems Security functions.
- **Modify user rights of Kaspersky Security Service management.** View and [configure user rights to manage Kaspersky Security Service](#).
- **Export settings.** Save the [application settings in a configuration file in XML format](#). You can also perform this operation in context menus of application tasks.
- **Import settings.** [Import application settings from a configuration file in XML format](#). You can also perform this operation in context menus of application tasks.
- **Information about the application and available module updates.** See information about Kaspersky Embedded Systems Security and currently available application modules updates.
- **Refresh.** Refresh the contents of the Application Console window. You can also perform this operation in context menus of application tasks.
- **Properties.** View and configure settings of Kaspersky Embedded Systems Security or a selected task. You can also perform this operation in context menus of application tasks.

To do so, you can also use the **Application properties** link in the details pane of the **Kaspersky Embedded Systems Security** node or use the button on the toolbar.

- **Help.** View information in Kaspersky Embedded Systems Security Help. You can also perform this operation in context menus of application tasks.

## Toolbar and context menu of Kaspersky Embedded Systems Security tasks

You can manage Kaspersky Embedded Systems Security tasks using the items of context menus of each task in the Application Console tree.

You can use the items of the context menu to perform the following operations:

- **Start / Stop.** [Start or stop task](#) execution. To carry out these operations, you can also use the buttons on the toolbar.
- **Resume / Pause.** [Resume or pause task](#) execution. To carry out these operations, you can also use the buttons on the toolbar. This operation is available for the Real-Time Computer Protection tasks and the On-Demand Scan tasks.

- **Add task.** [Create new custom task](#). This operation is available for On-demand scan tasks.
- **Open log.** [View and manage a task log](#). This operation is available for all tasks.
- **Remove task.** Delete custom task. This operation is available for On-demand scan tasks.
- **Settings templates.** [Manage templates](#). This operation is available for Real-Time File Protection and On-Demand Scan.

## System Tray Icon in the notification area

Every time Kaspersky Embedded Systems Security automatically starts after a protected device restart, the System Tray Icon is displayed in the toolbar notification area **k**. It is displayed by default if the System Tray Icon component was installed during application setup.

The appearance of the System Tray Icon reflects the current device protection status. There are two types of status:

<b>k</b>	Active (colored icon) – at least one of the following tasks is currently running: Real-Time File Protection or Applications Launch Control
<b>k</b>	Inactive (gray icon) – none of the following tasks are currently running: Real-Time File Protection and Applications Launch Control

You can open the context menu of the System Tray Icon by right-clicking it.

The context menu offers several commands to display application windows (see table below).

Context menu commands in System Tray Icon

Command	Description
<b>Open the Application Console</b>	Opens Kaspersky Embedded Systems Security Console (if installed).
<b>Open Compact Diagnostic Interface</b>	Opens the Compact Diagnostic Interface.
<b>About the application</b>	Opens the <b>About the application</b> window containing information about Kaspersky Embedded Systems Security.  For registered Kaspersky Embedded Systems Security users, the <b>About the application</b> window contains information about urgent updates that have been installed.
<b>Hide</b>	Hides the System Tray Icon in the toolbar notification area.

You can display the hidden System Tray Icon again at any time.

*To display the System Tray Icon again,*

in the Microsoft Windows **Start** menu, select **All Programs > Kaspersky Embedded Systems Security > System Tray Icon**.

The names of settings may vary depending on the installed operating system.

In the general settings of Kaspersky Embedded Systems Security, you can enable or disable the display of the System Tray Icon every time the application starts automatically following a protected device restart.

## Managing Kaspersky Embedded Systems Security via the Application Console on another device

You can manage Kaspersky Embedded Systems Security via the Application Console installed on a remote device.

To manage the application using Kaspersky Embedded Systems Security Console on a remote device, make sure that:

- The Application Console users on the remote device are added to the ESS Administrators group on the protected device.
- Network connections are allowed for the Kaspersky Security Management Service process (kavfsgt.exe) if Windows Firewall is enabled on the protected device.
- During installation of Kaspersky Embedded Systems Security, the **Allow remote access** check box is selected in the Installation Wizard window.

If Kaspersky Embedded Systems Security on the remote device is password protected, enter the password to access application management via the Application Console.

## Configuring general application settings via the Application Console

General settings and malfunction diagnosis settings of Kaspersky Embedded Systems Security establish the general operating conditions for the application. These settings allow you to control the number of working processes used by Kaspersky Embedded Systems Security, enable recovery of Kaspersky Embedded Systems Security tasks after an abnormal termination, maintain the log, enable creation of dump files of Kaspersky Embedded Systems Security processes after abnormal termination, and configure other general settings.

Application settings cannot be configured in the Application Console if the active Kaspersky Security Center policy blocks changes to these settings.

*To configure Kaspersky Embedded Systems Security settings:*

1. In the Application Console tree, select the **Kaspersky Embedded Systems Security** node and do one of the following:

- Click the **Application properties** link in the details pane of the node.
- Select **Properties** in the node context menu.

The **Application settings** window opens.

2. In the window that opens, configure Kaspersky Embedded Systems Security general settings according to your preferences:

- The following settings can be configured on the **Scalability and interface** tab:
  - In the **Scalability settings** section:
    - [Number of processes for Real-Time Computer Protection](#)
    - [Number of working processes for background On-Demand Scan tasks](#)
  - In the **Interaction with user** section select if the System Tray Icon will be displayed in the [taskbar after each application start](#).
- The following settings can be configured on the **Security and reliability** tab:
  - In the **Password protection settings** section, configure the [protection of application processes](#).
  - In the **Password protection settings** section, configure the settings for [password-protection of the application functions](#).
  - In the **Self-defense** section, specify the [number of attempts to recover an On-Demand Scan task](#) if it crashes.
  - In the **Recover on-demand scan tasks no more than (times)** section, specify [actions that Kaspersky Embedded Systems Security performs after switching to UPS power](#).
- On the **Scan settings** tab:
  - [Restore file attributes after scanning](#)
  - [Limit CPU usage for scanning threads](#)
  - [Upper limit \(per cent\)](#)
  - [Folder for temporary files created during scanning](#)
- On the **Connection settings** tab:
  - In the **Proxy server settings** section, specify the proxy server settings.
  - In the **Proxy server authentication settings** section, specify the authentication type and details required for authentication on the proxy server.
  - In the **Licensing** section, indicate whether Kaspersky Security Center will be used as a proxy-server for application activation.
- On the **Malfunction diagnosis** tab:
  - If you want the application to write debug information to a file, in the **Troubleshooting settings** subsection, select the **Enable tracing** check box.
  - In the **Traces folder** field, specify the absolute path to a local folder where Kaspersky Embedded Systems Security will save trace files.

The folder must be created beforehand and must be available for writing for SYSTEM account. You cannot specify a network folder, a drive, and environment variables.

- Configure [the level of details of debug information](#).
- Specify the **Maximum size of trace files**.  
Available values: from 1 to 4095 MB. By default, the maximum size of trace files is set to 50 MB.
- If you want the application to remove the oldest files after the maximum number of trace files is reached, select the **Remove the oldest trace files** check box.
- Specify the **Maximum number of files for one trace log**.  
Available values: from 1 to 999. By default, the maximum number of files is set to 5. The field is available only if the **Remove the oldest trace files** check box is selected.
- If you want the application to create a dump file, select the **Create dump file** check box.
- In the **Dump files folder** field, specify the absolute path to a local folder where Kaspersky Embedded Systems Security will save the dump file.  
The folder must be created beforehand and must be available for writing for SYSTEM account. You cannot specify a network folder, a drive, and environment variables.

Kaspersky Embedded Systems Security writes information to trace files and the dump files in unencrypted form. The folder where files are saved is selected by the user and is managed by the operating system configuration and Kaspersky Embedded Systems Security settings. You can configure access permissions and allow only required users to access logs, trace files, and dump files.

3. Click **OK**.

Kaspersky Embedded Systems Security settings are saved.

## Managing Kaspersky Embedded Systems Security tasks

This section contains information about how to create, configure, start, and stop Kaspersky Embedded Systems Security tasks.

### Kaspersky Embedded Systems Security task categories

Real-Time Computer Protection, Computer Control, On-Demand Scan, and Update functions in Kaspersky Embedded Systems Security are implemented as tasks.

You can manage these tasks using the task context menu in the Application Console tree, the toolbar, and the quick access bar. You can view task status information in the results pane. Task management operations are recorded in the system audit log.

There are two types of Kaspersky Embedded Systems Security tasks: *local* and *group*.

#### Local tasks

Local tasks can only be executed on the protected device they were created for. Depending on the start method, the following types of local tasks exist:

- **Local system tasks.** These tasks are created automatically during installation of Kaspersky Embedded Systems Security. You can edit the settings of all local system tasks, except for the Quarantine Scan and Rollback of Database Update tasks. Local system tasks cannot be renamed or deleted. You can run local system and custom On-Demand Scan tasks simultaneously.
- **Local custom tasks.** In the Application Console, you can create On-Demand Scan tasks. In Kaspersky Security Center, you can create On-Demand Scan, Database Update, Rollback of Database Update, and Copying Updates tasks. You can rename, configure, and delete custom tasks. You can run several custom tasks simultaneously.

## Group tasks

You can manage group tasks and tasks for sets of protected devices from the Kaspersky Security Center. All group tasks are custom tasks. Group tasks are also displayed in the Application Console. In the Application Console, you can only view the status of group tasks. You cannot use the Application Console to manage or configure group tasks.

## Starting, pausing, resuming, and stopping tasks manually

You can pause and resume only Real-Time Computer Protection and On-Demand Scan tasks. No other tasks can be paused or resumed manually.

*To start, pause, resume or stop a task:*

1. In the Application Console, open the context menu of the task.
2. Select one of the following: **Start**, **Pause**, **Resume** or **Stop**.

The operation is performed and recorded in the [system audit log](#).

When you resume an On-Demand Scan task, Kaspersky Embedded Systems Security resumes scanning from the object on which the scan was paused.

## Managing task schedules

You can schedule Kaspersky Embedded Systems Security tasks.

## Configuring the task schedule settings

In the Application Console, you can schedule when to start local system and custom tasks. However, you cannot schedule when to start group tasks.

*To schedule a task:*

1. Open the context menu of the task you want to schedule.

2. Select **Properties**.

The **Task settings** window opens.

3. In the window that opens, on the **Schedule** tab, select the **Run by schedule** check box.

4. Follow these steps to specify schedule settings:

a. In the **Frequency** drop-down menu, select one of the following:

- **Hourly**: to run the task at hourly intervals; specify the number of hours in the **Every <number> hour(s)** field.
- **Daily**: to run the task at daily intervals; specify the number of days in the **Every <number> day(s)** field.
- **Weekly**: to run the task at weekly intervals; specify the number of weeks in the **Every <number> week(s) on** field. Specify the days of the week to start the task (by default the task runs on Mondays).
- **At application launch**: to run the task every time Kaspersky Embedded Systems Security starts.
- **After application database update**: to run the task after every update of the application database.

b. In the **Start time** field, specify the time when to start the task for the first time.

c. In the **Start date** field, specify the date when to start the task for the first time.

After you have specified the task start frequency, the time of the first task start, and the date from which the schedule applies, the estimated time for the next task start will appear in the top part of the window in the **Next start** field. The estimated time of the next task start will be updated and displayed each time you open the **Task settings** window on the **Schedule** tab.

The **Next start** field displays the **Blocked by policy** value if Kaspersky Security Center active policy settings prohibit a scheduled local system task from starting.

5. Use the **Advanced** tab to specify the following schedule settings:

- In the **Task stop settings** section:
  - a. Select the **Duration** check box. In the fields to the right, enter maximum task duration in hours and minutes.
  - b. Select the **Pause from** check box. In the fields to the right, enter when to pause and resume the task (under 24 hours).
- In the **Advanced settings** section:
  - a. Select the **Cancel schedule from** check box and specify the task schedule end date.
  - b. Select the **Run skipped tasks** check box to start skipped tasks.
  - c. Select the **Randomize the task start within interval of** check box and specify a value in minutes.

6. Click **OK**.

The task schedule settings are saved.

## Enabling and disabling scheduled tasks

You can enable and disable scheduled tasks before or after specifying task schedule settings.

*To enable or disable a scheduled task start:*

1. In the Application Console tree, open the context menu for the scheduled task.
2. Select **Properties**.

The **Task settings** window opens.

3. In the window that opens, on the **Schedule** tab, select one of the following options:

- Select the **Run by schedule** check box to enable scheduled task start.
- Clear the **Run by schedule** check box to disable scheduled task start.

The task schedule settings are not deleted, but applied the next time you enable a scheduled task start.

4. Click **OK**.

The task schedule settings are saved.

## Using user accounts to start tasks

You can start tasks under the system account or specify a different account.

## About using accounts to start tasks

You can specify the account to run the following Kaspersky Embedded Systems Security tasks:

- Rule Generator for Applications Launch Control
- Rule Generator for Device Control
- On-Demand Scan
- Update

By default, these tasks are run using system account permissions.

A different account with proper access permissions is recommended in the following cases:

- **Update** task: if you specified a public folder on a different device on the network as the update source.
- **Update** task: if you use a proxy server with built-in Windows NTLM authentication to access the update source.

- **On-Demand Scan** tasks: if the system account does not have permission to access the scanned objects (for example, files in shared folders on the protected device).
- **Rule Generator for Applications Launch Control** task: if the generated rules are exported to a configuration file that the system account cannot access (for example, in a shared folder on the protected device).

You can run Update, On-Demand Scan, and Rule Generator tasks with system account permissions. Kaspersky Embedded Systems Security performs these tasks and accesses shared folders on another device in the network if this device is registered in the same domain as the protected device. In this case, the system account must have access permissions for these folders. Kaspersky Embedded Systems Security accesses the device using permissions for the account **<domain name \ device\_name>**.

## Specifying a user account to start a task

*To specify an account to start a task:*

1. In the Application Console tree, open the context menu of the task you want to start by using a specific account.
2. Select **Properties**.  
The **Task settings** window opens.
3. In the window that opens, on the **Run as** tab, follow these steps:
  - a. Select **User name**.
  - b. Enter the user name and password for the account you want to use.

The selected user must be registered on the protected device or in the same domain as this protected device.

- c. Confirm the password.
4. Click **OK**.  
The modified settings are saved.

## Importing and exporting settings

This section explains how to export Kaspersky Embedded Systems Security settings. You will also learn how to export specific software settings to an XML configuration file, and how to import these settings from a configuration file back into the application.

## About importing and exporting settings

You can export Kaspersky Embedded Systems Security settings to an XML configuration file and import settings into Kaspersky Embedded Systems Security from the configuration file. You can save all application settings or only settings for individual components to a configuration file.

When you export all settings of Kaspersky Embedded Systems Security to a file, the general application settings and settings of the following Kaspersky Embedded Systems Security components and functions are saved:

- Real-Time File Protection
- KSN Usage
- Device Control
- Applications Launch Control
- Rule Generator for Device Control
- Rule Generator for Applications Launch Control
- On-Demand Scan tasks
- File Integrity Monitor
- Log Inspector
- Kaspersky Embedded Systems Security database and software modules update
- Quarantine
- Backup
- Logs
- Administrator and user notifications
- Trusted Zone
- Exploit Prevention
- Password protection

Also, you can save the general settings of Kaspersky Embedded Systems Security in the file, as well as the rights of user accounts.

You cannot export group task settings.

Kaspersky Embedded Systems Security exports all passwords used by the application, for example, user account settings for running tasks or connecting to a proxy server. Exported passwords are saved in encrypted form in the configuration file. You can import passwords only using Kaspersky Embedded Systems Security installed on this protected device if it has not been reinstalled or updated.

You cannot import previously saved passwords using Kaspersky Embedded Systems Security installed on a different protected device. After settings have been imported on another protected device, all passwords must be entered manually.

If a Kaspersky Security Center policy is active at the time of export, the application exports the specified values used by that policy.

Settings from a configuration file containing parameters for individual components of Kaspersky Embedded Systems Security (e.g., from a file created in Kaspersky Embedded Systems Security installed with incomplete set of components) can be imported. After the settings are imported, only those Kaspersky Embedded Systems Security settings that were contained in the configuration file are changed. All other settings remain the same.

Settings of an active Kaspersky Security Center policy that have been blocked do not change when importing the settings.

## Exporting settings

*To export settings to a configuration file:*

1. In the Application Console tree, do one of the following:
  - In the context menu of the **Kaspersky Embedded Systems Security** node, select **Export settings** to export all Kaspersky Embedded Systems Security settings.
  - In the context menu of a specific task, select **Export settings** to export the settings of an individual functional component of the application.
  - To export the Trusted Zone settings:
    - a. In the Application Console tree, open the **Kaspersky Embedded Systems Security** node context menu.
    - b. Select **Configure Trusted Zone settings**.  
The **Trusted Zone** window opens.
    - c. Click the **Export** button.  
The Settings Export Wizard opens.
2. Follow the instructions in the **Settings Export Wizard**: specify the name and path of the configuration file you want to use to save the settings.

You can use system environment variables when specifying the path, but not user environment variables.

If a Kaspersky Security Center policy is active at the time of export, the application exports the settings used by that policy.

3. Click the **Close** button in the **Export of application settings complete** window.

The Settings Export Wizard closes and saves the export settings.

## Importing settings

*To import settings from a saved configuration file:*

1. In the Application Console tree, do one of the following:

- In the context menu of the **Kaspersky Embedded Systems Security** node, select **Import settings** to import all Kaspersky Embedded Systems Security settings.
- In the context menu of a specific task, select **Import settings** to import the settings of an individual functional component of the application.
- To import the Trusted Zone settings:
  - a. In the Application Console tree, open the context menu of the **Kaspersky Embedded Systems Security** node.
  - b. Select **Configure Trusted Zone settings**.  
The **Trusted Zone** window opens.
  - c. Click the **Import** button.  
The Settings Import Wizard opens.

2. Follow the instructions in the **Settings Import Wizard**: specify the configuration file with the settings you want to import.

After importing the general Kaspersky Embedded Systems Security settings or its functional component settings to the protected device, you cannot revert to the previous settings.

3. Click the **Close** button in the **Application settings import completed** window.

The Settings Import Wizard closes and saves the imported settings.

4. In the Application Console toolbar, click the **Refresh** button.

The Application Console window displays the imported settings.

Kaspersky Embedded Systems Security does not import passwords (account credentials for starting tasks or connecting to the proxy server) from a file created on another protected device or on the same protected device after Kaspersky Embedded Systems Security has been re-installed or updated on it. After import is complete, passwords must be entered manually.

## Using security settings templates

This section contains information about using security settings templates in Kaspersky Embedded Systems Security protection and scan tasks.

## About security settings templates

You can manually configure the security settings of a node in the tree or in a list of the protected device's file resources, and save the configured setting values as a template. This template can then be used to specify the security settings of other nodes in Kaspersky Embedded Systems Security protection and scan tasks.

You can use templates to specify the security settings of the following Kaspersky Embedded Systems Security tasks:

- Real-Time File Protection
- Scan at Operating System Startup
- Critical Areas Scan
- On-Demand Scan tasks

Security settings from a template applied to a parent node in the protected device's file resource tree are applied to all child nodes. The parent node template is not applied to child nodes in the following cases:

- If you specified the security settings of the child nodes [separately](#).
- If the child nodes are virtual. In this case, you must apply the template to each virtual node separately.

## Creating a security settings template

*To manually save the security settings of a node to a template:*

1. In the Application Console tree, select the task for which you want to create a security settings template.
2. In the details pane of the selected task, click the **Configure protection scope** or **Configure scan scope** link.
3. In the tree or list of the protected device's network file resources, select the template that you want to view.
4. On the **Security level** tab, click the **Save as template** button.  
The **Template properties** window opens.
5. In the **Template name** field, enter the name of the template.
6. In the **Description** field, enter additional template information.
7. Click **OK**.

The security settings template is saved.

## Viewing security settings in a template

*To view security settings in a template that you created:*

1. In the Application Console tree, select the task with the security settings template want to view.
2. In the context menu of the selected task, select **Settings templates**.  
The **Templates** window opens.
3. In the list of templates, select the template that you want to view.
4. Click the **View** button.

The **<Template name>** window opens. The **General** tab displays the template name and additional information about the template. The **Options** tab lists security settings saved in the template.

## Applying a security settings template

*To apply security settings from a template to a selected node:*

1. In the Application Console tree, select the task to which you want to apply a security settings template.
2. In the details pane of the selected task, click the **Configure protection scope** or **Configure scan scope** link.
3. In the tree or list of the protected device's network file resources, open the context menu of the node or item to which you want to apply the template.
4. Select **Apply template** → **<Template name>**.
5. Click the **Save** button.

This applies the security settings template to the selected node in the file resource tree of the protected device. The value on the **Security level** tab for the selected node changes to **Custom**.

If the security settings of a template are applied to a parent node in the protected device file resource tree, these settings are also applied to all child nodes.

You can configure the protection or scan scope of child nodes in the file resource tree of the protected device separately. In this case, the security settings of the template applied to the parent node are not automatically applied to the child nodes.

*To apply security settings from a template to all selected nodes:*

1. In the Application Console tree, select the task to which you want to apply the security settings template.
2. In the details pane of the selected task, click the **Configure protection scope** or **Configure scan scope** link.
3. In the tree or list of the protected device's network file resources, select a parent node to apply the template to the selected node and its child nodes.
4. In the context menu, select **Apply template** → **<Template name>**.
5. Click the **Save** button.

The security settings template is applied to the parent and all child nodes in the protected device's file resource tree. The value on the **Security level** tab for the selected node changes to **Custom**.

## Deleting a security settings template

*To delete a security settings template:*

1. In the Application Console tree, select the task with the security settings template that you want to delete.

2. In the context menu of the selected task, select **Settings templates**.

The **Templates** window opens.

In the results pane of the **On-Demand Scan** parent node you can view settings templates for On-Demand Scan tasks.

3. In the list of templates, select the template that you want to delete.

4. Click the **Remove** button.

A window opens to confirm deletion.

5. In the window that opens, click **Yes**.

The selected template is deleted.

You can apply the security settings template to protect or scan nodes in the file resource tree of the protected device. In this case, the security settings for such nodes are unchanged after the template is deleted.

## Viewing protection status and Kaspersky Embedded Systems Security information

*To view information about the device protection status Kaspersky Embedded Systems Security,*

select the **Kaspersky Embedded Systems Security** node in the Application Console tree.

By default, information in the details pane of the Application Console is refreshed automatically:

- Every 10 seconds in case of a local connection.
- Every 15 seconds in case of a remote connection.

You can refresh the information manually.

*To refresh information in the **Kaspersky Embedded Systems Security** node manually,*

select the **Refresh** command in the context menu of the **Kaspersky Embedded Systems Security** node.

The following application information is displayed in the details pane of the Application Console:

- Kaspersky Security Network Usage status.
- Device protection status.
- Information about database and application module updates.
- Actual diagnostic data.

- Data about protected device control tasks.
- License information.
- Status of integration with Kaspersky Security Center: details of the server with Kaspersky Security Center installed and to which the application is connected; information about application tasks controlled by the active policy.

Different colors are used to indicate the protection status:

- *Green*. The task is being run in accordance with the configured settings. Protection is active.
- *Yellow*. The task was not started, has been paused, or has been stopped. Security threats may occur. You are advised to configure and start the task.
- *Red*. The task completed with an error or a security threat was detected while the task was running. You are advised to start the task or take measures to eliminate the detected security threat.

Some details in this block (for example, task names or the number of threats detected) are links that, when clicked, take you to the node of the relevant task or open the task log.

The **Kaspersky Security Network Usage** section displays current task status, for example, *Running*, *Stopped* or *Never performed*. The indicator can take the following values:

- Green color signifies that the KSN Usage task is running and file requests for statuses are being send to KSN.
- Yellow color signifies that one of the Statements is accepted, but the task is not running; or the task is running, but file requests are not sent to KSN.

## Computer protection

The **Computer protection** section (see the table below) displays information about the device's current protection status.

Information about device protection status

Protection section	Information
<b>Device protection status indicator</b>	<p>The color of the panel with the section name reflects the status of tasks being performed in the section. The indicator can take the following values:</p> <ul style="list-style-type: none"> <li>• Green – This color is displayed by default and signifies that Real-Time File Protection component is installed and the task is running.</li> <li>• Yellow – The Real-Time File Protection component is not installed, and the Critical Areas Scan task has not been performed for a long time.</li> <li>• Red – Real-Time File Protection task is not running.</li> </ul>
<b>Real-Time File Protection</b>	<p><b>Task status</b> – Current task status, for example, <i>Running</i> or <i>Stopped</i>.</p> <p><b>Detected</b> – Number of objects detected by Kaspersky Embedded Systems Security. For example, if Kaspersky Embedded Systems Security detects one malicious application in five files, the value in this field increases by one. If the number of detected malicious applications exceeds 0, the value is highlighted in red.</p>

<b>Critical Areas Scan</b>	<p><b>Last scan date</b> – Date and time of the last Critical Areas Scan for viruses and other computer security threats.</p> <p><i>Never performed</i> – An event that occurs when the Critical Areas Scan task has not been performed in the last 30 days or longer (default value). You can change the threshold for generating this event.</p>
<b>Exploit prevention</b>	<p><b>Status</b> – current status of exploit prevention techniques, for example, <i>Applied</i> or <i>Not applied</i>.</p> <p><b>Prevention mode</b> – one of two available modes, selected during configuration of process memory protection: <b>Terminate on exploit</b> or <b>Statistics only</b>.</p> <p><b>Processes protected</b> – the total number of processes added to the protection scope and handled in accordance with the selected mode.</p>
<b>Backed up objects</b>	<p><i>Backup free space threshold exceeded</i> – This event occurs when the amount of free space in Backup is approaching the specified limit. Kaspersky Embedded Systems Security continues to move objects to Backup. In this case, the value in the <b>Space used</b> field is highlighted in yellow.</p> <p><i>Maximum Backup size exceeded</i> – This event occurs when the Backup size has reached the specified limit. Kaspersky Embedded Systems Security continues to move objects to Backup. In this case, the value in the <b>Space used</b> field is highlighted in red.</p> <p><b>Backed up objects</b> – Number of objects currently in Backup.</p> <p><b>Space used</b> – Amount of Backup space used.</p>

## Update

The **Update** section (see the table below) displays information about how up-to-date the anti-virus databases and application modules are.

Information about the status of Kaspersky Embedded Systems Security databases and modules

<b>Update section</b>	<b>Information</b>
<b>Status indicator for databases and software modules</b>	<p>The color of the panel with the section name reflects the status of application databases and modules. The indicator can take the following values:</p> <ul style="list-style-type: none"> <li>• Green – This color is displayed by default and signifies that application databases are up to date and that the last database update task was completed successfully.</li> <li>• Yellow – Databases are out of date, or the last database update task failed.</li> <li>• Red – The event <i>Application database is extremely out of date</i> or <i>Application database is corrupted</i> has occurred.</li> </ul>
<b>Database Update and Software Modules Update</b>	<p><b>Database status</b> – An evaluation of the Database Update status.</p> <p>It can take the following values:</p> <ul style="list-style-type: none"> <li>• <b>Application database is up to date</b> – Application databases were updated no more than 7 days ago (default).</li> <li>• <b>Application database is out of date</b> – Application databases were updated between 7 and 14 days ago (default).</li> <li>• <b>Application database is extremely out of date</b> – Application databases were updated more than 14 days ago (default). You can change the thresholds for generating the <i>Application database is up to date</i> and <i>Application database is extremely out of date</i> events.</li> </ul>

**Database release date** – Date and time of the release of the latest database update. The date and time are specified in UTC format.

**Status of the latest completed Database Update task** – Date and time of the latest database update. The date and time are specified according to the local time of the protected device. The field is red if the *Failed* event occurred.

**Number of module updates available** – Number of Kaspersky Embedded Systems Security module updates available to be downloaded and installed.

**Number of module updates installed** – Number of installed Kaspersky Embedded Systems Security module updates.

## Control

The **Control** section (see table below) displays information about the Applications Launch Control, Device Control and Firewall Management tasks.

Information about protected device control status

Control section	Information
<b>Status indicator for protected device control</b>	<p>The color of the panel with the section name reflects the status of tasks being performed in the section. The indicator can take the following values:</p> <ul style="list-style-type: none"> <li>Green – This color is displayed by default and signifies that the Applications Launch Control component is installed and the task is running in the <b>Active</b> mode.</li> <li>Yellow – Applications Launch Control is running in the <b>Statistics only</b> mode.</li> <li>Red – The Applications Launch Control task is not running or failed.</li> </ul>
<b>Applications Launch Control</b>	<p><b>Task status</b> – Current task status, for example, <i>Running</i> or <i>Stopped</i>.</p> <p><b>Operation mode</b> – One of the two available modes for the Applications Launch Control task: <b>Active</b> or <b>Statistics only</b>.</p> <p><b>Applications launches denied</b> – Number of attempts to start applications blocked by Kaspersky Embedded Systems Security during the Applications Launch Control task. If the number of blocked application launches exceeds 0, the field is red.</p> <p><b>Average processing time (ms)</b> – Time taken by Kaspersky Embedded Systems Security to process an attempt to start applications on the protected device.</p>
<b>Device control</b>	<p><b>Task status</b> – current task status, for example, <i>Running</i> or <i>Stopped</i>.</p> <p><b>Operation mode</b> – one of the two available modes for the Device Control task: <b>Active</b> or <b>Statistics only</b>.</p> <p><b>Devices blocked</b> – the number of attempts to connect an external device, that were blocked by Kaspersky Embedded Systems Security during the Device Control task. If the number of blocked external devices exceeds 0, the field value is colored in red.</p>
<b>Firewall Management</b>	<p><b>Task status</b> – current task status, for example, <i>Running</i> or <i>Stopped</i>.</p> <p><b>Connection attempts blocked</b> – Number of connections to a protected device that were blocked by the specified firewall rules.</p>

## Diagnostics

The **Diagnostics** section (see the table below) displays information about the File Integrity Monitor and Log Inspection tasks.

Information about System Inspection status

Diagnostics section	Information
<b>Diagnostics status indicator</b>	<p>The color of the panel with the section name reflects the status of tasks being performed in the section. The indicator can take the following values:</p> <ul style="list-style-type: none"> <li>• Green – This color is displayed by default and signifies that one or both system inspection components are installed and tasks are running.</li> <li>• Yellow – Both components are installed, but one of the system inspection tasks is not running; the <i>Not running</i> event occurred.</li> <li>• Red – One of the tasks failed.</li> </ul>
<b>File Integrity Monitor</b>	<p><b>Task status</b> – Current task status, for example, <i>Running</i> or <i>Stopped</i>.</p> <p><b>Non-sanctioned file operations</b> – Number of changes to files within the monitoring scope. These changes may indicate that the security of a protected device has been breached.</p>
<b>Log Inspection</b>	<p><b>Task status</b> – Current task status, for example, <i>Running</i> or <i>Stopped</i>.</p> <p><b>Violations of the configured rules</b> – Number of recorded violations based on data from the Windows Event Log. This number is determined based on the specified task rules or using the heuristic analyzer.</p>

The Kaspersky Embedded Systems Security licensing information is displayed in the row in the bottom left corner of the details pane of the **Kaspersky Embedded Systems Security** node.

You can configure Kaspersky Embedded Systems Security properties by following the [Application properties](#).

You can connect to a different protected device by following the [Connect to another computer link](#).

## Working with the Web Plug-in from Web Console and Cloud Console

This section provides information about the Kaspersky Embedded Systems Security Administration Plug-in and describes how to manage the application installed on a protected device or on a group of protected devices.

## Managing Kaspersky Embedded Systems Security from Web Console and Cloud Console

You can centrally manage several protected devices with Kaspersky Embedded Systems Security installed and included in an administration group via the Kaspersky Embedded Systems Security Web Plug-in. Kaspersky Security Center Web Console and Kaspersky Security Center Cloud Console also let you separately configure each protected device in the administration group.

*An administration group* is created manually on Kaspersky Security Center Web Console. The group includes several devices with Kaspersky Embedded Systems Security installed for which you want to configure the same control and protection settings. For details on using administration groups, see *Kaspersky Security Center Help*.

Application settings for a single protected device are unavailable if the operation of Kaspersky Embedded Systems Security on the protected device is controlled by an active Kaspersky Security Center policy.

Kaspersky Embedded Systems Security can be managed from Kaspersky Security Center Web Console in the following ways:

- **Using Kaspersky Security Center policies.** Kaspersky Security Center policies can be used to remotely configure the same protection settings for a group of devices. Task settings specified in the active policy have priority over task settings configured locally in the Application Console or remotely in the device properties window of Kaspersky Security Center Web Console. You can use policies to configure general application settings, Real-Time Computer Protection task settings, Local Activity Control tasks settings, and scheduled local system task start settings.
- **Using Kaspersky Security Center group tasks.** Kaspersky Security Center group tasks allow remote configuration of common settings of tasks with an expiration period for a group of devices. You can use group tasks to activate the application, configure On-Demand Scan task settings, update task settings, and Rule Generator for Applications Launch Control task settings.
- **Using tasks for a set of devices.** Tasks for a set of devices allow remote configuration of common task settings with a limited execution period for protected devices that do not belong to any administration group.
- **Using the properties window of a single device.** In the device properties window, you can remotely configure the task settings for a single protected device included in an administration group. You can also configure both general application settings and settings for all Kaspersky Embedded Systems Security tasks if the selected protected device is not controlled by an active Kaspersky Security Center policy.

Kaspersky Security Center Web Console and Kaspersky Security Center Cloud Console allow you to configure application settings and advanced features, and work with logs and notifications. You can configure these settings for a group of protected devices and for individual protected devices.

## Web Plug-in limitations

Kaspersky Embedded Systems Security Web Plug-in has the following limitations compared to Kaspersky Embedded Systems Security Administration Plug-in:

- To add users or user groups, you need to specify the security descriptor strings using the security descriptor definition language (SDDL).
- Predefined security level cannot be changed for the Real-Time File Protection task.
- Application Launch Control task rules cannot be created using digital certificate or Kaspersky Security Center events.
- Device Control task rules cannot be generated based on connected devices or on system data.

## Managing application settings

This section contains information about configuring Kaspersky Embedded Systems Security general settings in Kaspersky Security Center Web Console.

### Configuring general application settings in Web Plug-in

You can configure Kaspersky Embedded Systems Security general settings in Web Plug-in for a group of protected devices or one protected device.

### Configuring scalability, interface, and scan settings in Web Plug-in

*To configure scalability settings and the application interface:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the <Policy name> window that opens select the **Application settings** tab.
4. Select the **Application settings** section.
5. Click **Settings** in the **Scalability, interface and scan settings** subsection.
6. Configure the settings described in the table below.

Scalability settings

Setting	Description
Automatically detect scalability settings	Kaspersky Embedded Systems Security automatically controls the number of processes used. This is the default value.
Set the number of working processes manually	Kaspersky Embedded Systems Security controls the number of active working processes according to the values specified.
Number of	Maximum number of processes that are used by the Real-Time Computer Protection

processes for real-time protection	task components. The entry field is available if the <b>Set the number of working processes manually</b> option is selected.
Number of processes for background on-demand scan tasks	Maximum number of processes used by the On-Demand Scan component when running On-Demand Scan tasks in background mode. The entry field is available if the <b>Set the number of working processes manually</b> option is selected.
Display System Tray Icon in the taskbar	Configure whether the System Tray Icon will be displayed in the notification area.
<a href="#">Restore file attributes after scanning</a>	<p>When Kaspersky Embedded Systems Security performs on-demand scan tasks, the time when each scanned file was last accessed is updated. After the scan, Kaspersky Embedded Systems Security resets the time when the file was last accessed to the initial value.</p> <p>This behavior can affect the work of backup systems by causing creation of backup copies for files that haven't been changed. This can also cause false detections in file change tracking applications.</p> <p>By default, this option is enabled.</p>
Limit CPU usage for scanning threads	<p>Kaspersky Embedded Systems Security limits its use of the protected device CPU during on-demand scan tasks to the value specified in the <b>Upper limit (per cent)</b> field.</p> <p>Enabling of this option can negatively affect the performance of Kaspersky Embedded Systems Security.</p> <p>By default, this option is disabled.</p>
Upper limit (in percentages)	<p>Maximum allowable value of CPU utilization by Kaspersky Embedded Systems Security.</p> <p>The entry field is available if the <a href="#">Limit CPU usage for scanning threads</a> option is selected.</p>
<a href="#">Folder for temporary files created during scanning</a>	<p>Folder into which Kaspersky Embedded Systems Security needs to unpack archive files during scanning.</p> <p>By default, the C:\Windows\Temp folder is used.</p>
HSM system settings	Select the option for accessing the hierarchical storage.

## Configuring security settings in Web Plug-in

To configure security settings manually, take the following steps:

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the <Policy name> window that opens select the **Application settings** tab.

4. Select the **Application settings** section.
5. Click **Settings** in the **Security and reliability** subsection.
6. Configure the settings described in the table below.

Security settings

Setting	Description
<p><b>Protect application processes from external threats</b></p>	<p>If the <b>Protect application processes from external threats</b> <input type="checkbox"/> check box is selected, the application protects its processes against code injection or accessing of processes data.</p> <p>When enabling or disabling the option, no need to restart the application services for changes to apply.</p> <p>The option is enabled by default.</p>
<p><b>Perform task recovery</b></p>	<p>This check box enables or disables the recovery of Kaspersky Embedded Systems Security tasks when the application returns an error or terminates.</p> <p>If the check box is selected, Kaspersky Embedded Systems Security automatically recovers Kaspersky Embedded Systems Security tasks when the application returns an error or terminates.</p> <p>If the check box is cleared, Kaspersky Embedded Systems Security does not recover Kaspersky Embedded Systems Security tasks when the application returns an error or terminates.</p> <p>The check box is selected by default.</p>
<p>Recover On-Demand Scan tasks no more than (times) in range 1 - 10 attempts</p>	<p>The number of attempts to recover an On-Demand Scan task after Kaspersky Embedded Systems Security returns an error. The entry field is available if the <b>Perform task recovery</b> check box is selected.</p>
<p>Do not start scheduled scan tasks</p>	<p>This check box enables or disables the start of a scheduled scan task after the protected device switches to a UPS source until the standard power supply is restored.</p> <p>If the check box is selected, Kaspersky Embedded Systems Security does not start scheduled scan tasks after the protected device switches to a UPS source until the standard power supply is restored.</p> <p>If the check box is cleared, Kaspersky Embedded Systems Security starts scheduled scan tasks regardless of the power supply.</p> <p>The check box is selected by default.</p>
<p>Stop current scan tasks</p>	<p>The check box enables or disables running scan tasks after the protected device switches to a UPS source.</p> <p>If the check box is selected, Kaspersky Embedded Systems Security pauses running scan tasks after the protected device switches to a UPS source.</p> <p>If the check box is cleared, Kaspersky Embedded Systems Security continues running scan tasks after the protected device switches to a UPS source.</p> <p>The check box is selected by default.</p>
<p>Apply password protection</p>	<p>Set a password to protect access to Kaspersky Embedded Systems Security functions.</p>

## Configuring connection settings in Web Plug-in

The configured connection settings are used to connect Kaspersky Embedded Systems Security to update and activation servers and during integration of applications with KSN services.

*To configure the connection settings take the following steps:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **Application settings** section.
5. Click **Settings** in the **Scalability, interface and scan settings** subsection.
6. Configure the settings described in the table below.

Connection settings

Setting	Description
Do not use proxy server	If this option is selected, Kaspersky Embedded Systems Security connects to KSN services directly, without using any proxy server.
Use specified proxy server settings	If this option is selected, Kaspersky Embedded Systems Security connects to KSN using proxy server settings specified manually.
Do not use proxy server for local addresses	<p>This check box enables or disables the use of a proxy server when accessing devices located in the same network as the protected device with Kaspersky Embedded Systems Security installed.</p> <p>If this check box is selected, devices are accessed directly from the network that hosts the protected device with Kaspersky Embedded Systems Security installed. No proxy server is used.</p> <p>If the check box is cleared, a proxy server is used to connect to local devices.</p> <p>The check box is selected by default.</p>
Proxy server authentication settings	Specify the authentication settings
<b>Do not use authentication</b>	Authentication is not performed. This mode is selected by default.
<b>Use NTLM authentication</b>	Authentication is performed using the NTLM network authentication protocol developed by Microsoft.
<b>Use NTLM authentication with user name and password</b>	Authentication is performed with a user name and password using the NTLM network authentication protocol developed by Microsoft.
<b>Apply user name and</b>	Authentication is performed using the user name and password.

## Configuring scheduled start of local system tasks

You can use policies to allow or block the start of the local system On-Demand Scan task and the Update task. This is done according to the schedule configured locally on each protected device in the administration group:

- If the scheduled start of a specific type of local system task is prohibited by a policy, these tasks will not be performed on the protected device according to the schedule. You can start local system tasks manually.
- If the scheduled start of a specific type of local system task is allowed by a policy, these tasks will be performed in accordance with the scheduled parameters configured locally for this task.

By default, starting of local system tasks is prohibited by policy.

We recommend that you do not allow local system tasks to start if updates or on-demand scans are administered by Kaspersky Security Center group tasks.

If you do not use group update or on-demand scan tasks, allow local system tasks to be started in the policy: Kaspersky Embedded Systems Security will perform application database and module updates, and start all local system on-demand scan tasks in accordance with the default schedule.

You can use policies to allow or block the scheduled start of the following local system tasks:

- On-Demand Scan tasks: Critical Areas Scan, Quarantine Scan, Scan at Operating System Startup, Application Integrity Control, Baseline File Integrity Monitor.
- Update tasks: Database Update, Software Modules Update, Copying Updates.

If the protected device is excluded from the administration group, the local system tasks schedule will be enabled automatically.

*To allow or block the scheduled start of Kaspersky Embedded Systems Security local system tasks in a policy:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the <Policy name> window that opens select the **Application settings** tab.
4. Select the **Application settings** section.
5. Click **Settings** in the **Run local system tasks** subsection.
6. Configure the settings described in the table below.

Scheduled launch of local system tasks settings

Setting	Description
Allow on-demand scan tasks	Select or clear the check box to allow or disallow the scheduled launch of on-demand scan tasks.

launch	
Allow update tasks and Copying Update task launch	Select or clear the check box to allow or disallow the scheduled launch of update tasks and Copying Update task.

## Configuring Quarantine and Backup settings in Web Plug-in

To configure general Quarantine and Backup settings in Kaspersky Security Center:

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the <Policy name> window that opens select the **Application settings** tab.
4. Select the **Supplementary** section.
5. Click **Settings** in the **Storages** subsection.
6. Configure the settings described in the table below.

Quarantine and Backup settings

Setting	Description
<b>Backup folder</b>	Specify the backup folder.
<b>Maximum Backup size (MB)</b>	Set the maximum Backup size.
<b>Threshold value for space available (MB)</b>	Specify the minimum value of free space in the Backup folder.
<b>Target folder for restoring objects</b>	Specify a folder for restored objects.
<b>Quarantine folder</b>	Specify the backup folder.
<b>Maximum Quarantine size (MB)</b>	Set the maximum Backup size.
<b>Threshold value for space available (MB)</b>	Specify the minimum value of free space in the Backup folder.
<b>Target folder for restoring objects</b>	Specify a folder for restored objects.
<b>Network session blocking term</b>	Specify the number of days, hours and minutes after which blocked network sessions regain access to network file resources.

## Creating and configuring policies

This section provides information on using Kaspersky Security Center policies for managing Kaspersky Embedded Systems Security on several protected devices.

Global Kaspersky Security Center policies can be created for managing protection on several devices where Kaspersky Embedded Systems Security is installed.

A policy enforces the specified Kaspersky Embedded Systems Security settings, functions and tasks on all protected devices for one administration group.

Several policies for one administration group can be created and enforced in turns. The policy currently active for a group has *active* status in the Administration Console.

Information on policy enforcement is logged in the Kaspersky Embedded Systems Security system audit log. This information can be viewed in the Application Console in the **System audit log** node.

Kaspersky Security Center offers one way to apply policies on protected devices: *Prohibit changing the settings*. After a policy has been applied, Kaspersky Embedded Systems Security uses the settings for which you have selected the  icon in the policy properties on protected devices. In this case, the selected settings are used instead of the settings in effect before the policy was applied. Kaspersky Embedded Systems Security does not apply the active policy settings for which the  icon is selected in the policy properties.

If a policy is active, the values of settings marked with the  icon in the policy are displayed in the Application Console but cannot be edited. The values of other settings (marked with the  icon in the policy) can be edited in the Application Console.

The settings configured in the active policy and marked with the  icon also block changes in Kaspersky Security Center for one protected device in the **Properties: <Protected device name>** window.

Settings that are specified and sent to the protected device using an active policy are saved in the local task settings after the active policy is disabled.

If the policy defines the settings for any Real-Time Computer Protection task, and if such a task is currently running, then the settings defined by the policy will be modified as soon as the policy is applied. If the task is not running, the settings are applied when it starts.

## Creating a policy

*To create a policy:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the **Add** button.
3. The **New policy** window opens.
4. In the **Select application** section, select Kaspersky Embedded Systems Security and click **Next**.
5. On the **General** tab, you can perform the following actions:
  - Change the policy name.

The policy name cannot contain the following symbols: " \* < : > ? \ | .

- Select the policy status:

- **Active.** After the next synchronization, the policy will be used as the active policy on the computer.
- **Inactive.** Backup policy. If necessary, an inactive policy can be switched to active status.
- **Out-of-office.** The policy is activated when a computer leaves the organization network perimeter.
- Configure the inheritance of settings:
  - **Inherit settings from parent policy.** If this toggle button is switched on, the policy setting values are inherited from the top-level policy. Policy settings cannot be edited if  is set for the parent policy.
  - **Force inheritance of settings in child policies.** If the toggle button is on, the values of the policy settings are propagated to the child policies. In the child policy settings the **Inherit settings from parent policy** check box is automatically selected. Child policy settings are inherited from the parent policy, except for the settings marked with . Child policy settings cannot be edited if  is set for the parent policy.

6. On the **Application settings** tab, configure the policy settings as required.

7. Click **Save**.

The [created policy](#)  appears in the list of policies on the **Policies & profiles** tab of the selected administration group. In the **<Policy name>** window, you can configure other settings, tasks and functions of Kaspersky Embedded Systems Security.

After you created a new policy, a set of allowing rules is created to prevent the applications from being blocked and to ensure their continuous operation. You can view the default rules in the task settings. Following are the details and limitations.

By default, Kaspersky Embedded Systems Security creates a set of rules for incoming network traffic when you create a new policy:

- Two allowing rules for Kaspersky Security Center Network Agent Windows Desktop Sharing process, located at %Program Files% and %Program Files (x86)%. Status: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.
- Two allowing rules for local port 15000. State: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.

By default, Kaspersky Embedded Systems Security creates a set of rules for outgoing network traffic when you create a new policy:

- Two allowing rules for Kaspersky Embedded Systems Security Service, located at %Program Files% and %Program Files (x86)%. Status: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.
- Two allowing rules for Kaspersky Embedded Systems Security workflow process, located at %Program Files% and %Program Files (x86)%. Status: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.
- Two allowing rules for local port 13000. State: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.

# Kaspersky Embedded Systems Security policy settings sections

## General

In the **General** section, you can configure the following policy settings:

- Indicate the policy status.
- Configure the inheritance settings for parent and child policies.

## Event configuration

In the **Event configuration** section, you can configure settings for the following event categories:

- *Critical events*
- *Functional failure*
- *Warning*
- *Informational message*

You can use the **Properties** button to configure the following settings for the selected events:

- Indicate the storage location and retention period for information about logged events.
- Indicate the notification method for logged events.

## Application settings

Settings of the Application Settings section

Section	Options
<b>Scalability, interface and scan settings</b>	<p>In the <b>Scalability, interface and scan settings</b> subsection, you can click the <b>Settings</b> button to configure the following settings:</p> <ul style="list-style-type: none"><li>• Choose whether to configure scalability settings automatically or manually.</li><li>• Configure the application icon display settings.</li></ul>
<b>Security and reliability</b>	<p>In the <b>Security and reliability</b> subsection, you can click the <b>Settings</b> button to configure the following settings:</p> <ul style="list-style-type: none"><li>• Configure the task run settings.</li><li>• Specify how the application should behave when the protected device is running on UPS power.</li><li>• Enable or disable password-protection of application functions.</li></ul>

<b>Connections</b>	<p>In the <b>Connections</b> subsection, you can use the <b>Settings</b> button to configure the following proxy server settings for connecting with update servers, activation servers, and KSN:</p> <ul style="list-style-type: none"> <li>• Configure the proxy server settings.</li> <li>• Specify the proxy server authentication settings.</li> </ul>
<b>Run local system tasks</b>	<p>In the <b>Run local system tasks</b> subsection, you can use the <b>Settings</b> button to allow or block the start of the following local system tasks according to a schedule configured on protected devices:</p> <ul style="list-style-type: none"> <li>• On-Demand Scan task.</li> <li>• Update tasks and Copying Update task.</li> </ul>

## Supplementary

Settings of the Supplementary section

Section	Options
<b>Trusted Zone</b>	<p>Click the <b>Settings</b> button on the <b>Trusted Zone</b> subsection to configure the following Trusted Zone application settings:</p> <ul style="list-style-type: none"> <li>• Create a list of Trusted Zone exclusions.</li> <li>• Enable or disable scanning of file backup operations.</li> <li>• Create a list of trusted processes.</li> </ul>
<b>Removable Drives Scan</b>	<p>In the <b>Removable Drives Scan</b> subsection, you can use the <b>Settings</b> button to configure scan settings for removable drives.</p>
<b>User access permissions for application management</b>	<p>In the <b>User access permissions for application management</b> subsection, you can configure user rights and user group rights to manage Kaspersky Embedded Systems Security.</p>
<b>User access permissions for Kaspersky Security Service management</b>	<p>In the <b>User access permissions for Kaspersky Security Service management</b> subsection, you can configure user rights and user group rights to manage the Kaspersky Security Service.</p>
<b>Storages</b>	<p>In the <b>Storages</b> subsection, click the <b>Settings</b> button to configure the following Quarantine, Backup and Blocked Hosts settings:</p> <ul style="list-style-type: none"> <li>• Specify the path to the folder where you want to place Quarantine or Backup objects.</li> <li>• Configure the maximum size of Backup and Quarantine and also specify the free space threshold.</li> <li>• Specify the path to the folder where you want to place objects restored from Quarantine or Backup.</li> <li>• Configure transmission of information about Quarantine and Backup objects to Administration Server.</li> <li>• Configure how long hosts are blocked.</li> </ul>

## Real-time computer protection

Settings of the Real-Time Server Protection section

Section	Options
<b>Real-Time File Protection</b>	<p>In the <b>Real-Time File Protection</b> subsection, you can click the <b>Settings</b> button to configure the following task settings:</p> <ul style="list-style-type: none"><li>• Indicate the protection mode.</li><li>• Configure use of the Heuristic Analyzer.</li><li>• Configure use of the Trusted Zone.</li><li>• Indicate the protection scope.</li><li>• Set the security level for the selected protection scope: you can select a predefined security level or configure the security settings manually.</li><li>• Configure the task start settings.</li></ul>
<b>KSN Usage</b>	<p>In the <b>KSN Usage</b> subsection, you can click the <b>Settings</b> button to configure the following task settings:</p> <ul style="list-style-type: none"><li>• Indicate the actions to perform on KSN untrusted objects.</li><li>• Configure data transfer and usage of Kaspersky Security Center as a KSN proxy server.</li></ul>
<b>Exploit Prevention</b>	<p>In the <b>Exploit Prevention</b> subsection, you can click the <b>Settings</b> button to configure the following task settings:</p> <ul style="list-style-type: none"><li>• Select the process memory protection mode.</li><li>• Indicate the actions to reduce exploit risks.</li><li>• Add to and edit the list of protected processes.</li></ul>

## Local activity control

Settings of the Local Activity Control section

Section	Options
<b>Applications Launch Control</b>	<p>In the <b>Applications Launch Control</b> subsection, you can use the <b>Settings</b> button to configure the following task settings:</p> <ul style="list-style-type: none"><li>• Select the task operating mode.</li><li>• Configure settings for controlling subsequent application launches.</li><li>• Indicate the scope of the Applications Launch Control rules.</li><li>• Configure use of KSN.</li></ul>

	<ul style="list-style-type: none"> <li>• Configure the task start settings.</li> </ul>
<b>Device control</b>	<p>In the <b>Device control</b> subsection, you can click the <b>Settings</b> button to configure the following task settings:</p> <ul style="list-style-type: none"> <li>• Select the task operating mode.</li> <li>• Configure the task start settings.</li> </ul>

## Network activity control

Settings of the Network activity control section

Section	Options
<b>Firewall Management</b>	<p>In the <b>Firewall Management</b> subsection, you can click the <b>Settings</b> button to configure the following task settings:</p> <ul style="list-style-type: none"> <li>• Configure firewall rules.</li> <li>• Configure the task start settings.</li> </ul>

## System Inspection

Settings of the System Inspection section

Section	Options
<b>File Integrity Monitor</b>	<p>In the <b>File Integrity Monitor</b> subsection, you can configure control over changes in files that can signify a security breach on a protected device.</p>
<b>Log Inspection</b>	<p>In the <b>Log Inspection</b> section, you can configure a protected device integrity monitoring based on the results of an analysis of the Windows Event Log.</p>

## Logs and notifications

Settings of the Logs and Notifications section

Section	Options
<b>Task logs</b>	<p>In the <b>Task logs</b> subsection, you can click the <b>Settings</b> button to configure the following settings:</p> <ul style="list-style-type: none"> <li>• Specify the importance level of the logged events for the selected software components.</li> <li>• Specify the task log storage settings.</li> <li>• Specify the SIEM integration with Kaspersky Security Center settings.</li> </ul>
<b>Event notifications</b>	<p>In the <b>Event notifications</b> subsection, you can click the <b>Settings</b> button to configure the following settings:</p> <ul style="list-style-type: none"> <li>• Specify the user notification settings for the <i>Object detected</i>, <i>Untrusted mass storage detected and restricted</i>, and <i>Host listed as untrusted</i> events.</li> </ul>

	<ul style="list-style-type: none"> <li>Specify the administrator notification settings for any event selected in the event list in the <b>Notification settings</b> section.</li> </ul>
<b>Interaction with Administration Server</b>	In the <b>Interaction with Administration Server</b> subsection, you can click the <b>Settings</b> button to select the types of objects that Kaspersky Embedded Systems Security will report to Administration Server.

## Revision history

In the **Revision history** section, you can manage revisions: compare with the current revision or other policy, add descriptions of revisions, save revisions to a file or perform a rollback.

## Creating and configuring tasks using Kaspersky Security Center

This section contains information about Kaspersky Embedded Systems Security tasks, and how to create them, configure task settings, and start and stop them.

## About task creation in Web Plug-in

You can create group tasks for administration groups and sets of protected devices. The following types of tasks can be created:

- Activation of the Application
- Copying Updates
- Database Update
- Software Modules Update
- Rollback of Database Update
- On-Demand Scan
- Application Integrity Control
- Baseline File Integrity Monitor
- Rule Generator for Applications Launch Control
- Rule Generator for Device Control

You can create local and group tasks in the following ways:

- For one protected device: in the **Properties <Protected device name>** window in the **Tasks** section.
- For an administration group: in the details pane of the node of the selected group of protected devices on the **Tasks** tab.

- For a set of protected devices: in the details pane of the **Device selections** node.

You can use policies to disable [schedules for update and On-Demand Scan local system tasks](#) on all protected devices in the same administration group.

General information on tasks in Kaspersky Security Center is provided in the *Kaspersky Security Center Help*.

## Creating a task in Web Plug-in

To create a new task in the Kaspersky Security Center Administration Console:

1. Start the task wizard in one of the following ways:

- To create a local task:
  - a. In the main window of the Web Console, select **Devices** → **Managed devices**.
  - b. Click the **Groups** tab to select the administration group that the protected device belongs to.
  - c. Click the protected device name.
  - d. In the **<Device name>** window that opens select the **Tasks** tab.
  - e. Click **Add**.
- To create a group task:
  - a. In the main window of the Web Console, select **Devices** → **Managed devices**.
  - b. Click the **Groups** tab to select the administration group for which you want to create a task.
  - c. Click **Add**.
- To create a task for a custom set of protected devices:
  - a. In the main window of the Web Console, select **Devices** → **Device selections**.
  - b. Select the selection for which you want to create a task.
  - c. Click **Start**.
  - d. In the **Selection results** window, select the devices for which you want to create a task.
  - e. Click **New task**.

The task wizard window opens.

2. In the **Application** drop-down list, select **Kaspersky Embedded Systems Security**.

3. In the **Task type** drop-down list, select the type of the task to be created.

If you selected any task type except Rollback of Database Update, Application Integrity Control or Activation of the Application, the settings window opens.

4. Depending on the selected task type, do one of the following:

- [Create an On-Demand Scan task.](#)
- To create an update task, configure task settings based on your requirements:
  - a. Select an update source in the **Database update source** section.
  - b. In the **Connection settings** window, configure the proxy server settings.
- After creating a Software Modules Update task, configure the required application module update settings in the **Software Modules Update** window:
  - a. Select whether to copy and install critical software module updates, or only to check for their availability without installation.
  - b. If **Copy and install critical software modules updates** is selected: a protected device restart may be required to apply the installed software modules. If you wish Kaspersky Embedded Systems Security to restart the protected device automatically upon task completion, select the **Allow operating system restart** check box.
  - c. To obtain information about Kaspersky Embedded Systems Security module upgrades, select **Receive information about available scheduled software modules updates**.

Kaspersky does not publish planned update packages on the update servers for automatic installation; these can be downloaded manually from the Kaspersky website. An administrator notification about the **New scheduled software modules update is available** event can be configured. This will contain the URL of our website from which scheduled updates can be downloaded.
- To create the Copying Updates task, specify the set of updates and the destination folder in the **Copying Updates** window.
- To create the Activation of the Application task:
  - a. In the **List of keys in Kaspersky Security Center storage** window, specify the key file that you want to use to activate the application.
  - b. Select the **Use as additional key** check box if you want to create a task for renewing the license.
- Create and [configure the Rule Generator for Applications Launch Control task.](#)
- Create and [configure the Rule Generator for Device Control task.](#)

5. Click **Next**.

6. If the task is being created for a set of protected devices, select the network (or group) of protected devices on which this task will be executed.

7. Click **Next**.

8. In the **Finishing creation** window, select the **Open task details when creation is complete** check box if you want to configure task settings.

9. Click the **Finish** button.

The task created is displayed in the **Tasks** list.

## Configuring group tasks in Web Plug-in

*To configure a group task for multiple protected devices:*

1. In the main window of the Web Console, select **Devices** → **Tasks**.
2. Click the task name in the list of Kaspersky Security Center tasks.  
The <Task name> window opens.
3. Depending on the type of configured task, do one of the following:
  - To configure an On-Demand Scan task:
    - a. In the **Scan scope** section, configure a scan scope.
    - b. In the **Options** section, configure the task priority level and integration with other software components.
  - To configure an update task, adjust the task settings based on your requirements:
    - a. In the **Update sources** section, configure update source and proxy server settings.
    - b. In the **Optimization** section, configure disk subsystem optimization.
  - To configure the Software Modules Update task, in the **Advanced settings** section, choose an action to perform: copy and install critical updates of software modules or only check for them.
  - To configure the Copying Updates task, specify the set of updates and the destination folder in the **Copying updates settings** section.
  - To configure the Activation of the Application task, apply the key file that you want to use to activate the application. Select the **Use as additional key** check box if you want to add an activation code or key file for renewing the license.
  - To configure the automatic generation of allowing rules for Device Control, specify the settings that will be used to create the list of allowing rules.
4. Configure the task schedule in the **Schedule** section (you can configure a schedule for all task types except Rollback of Database Update).
5. On the **Settings** tab in the **Account** section, specify the account whose rights will be used to run the task. For detailed information on configuring settings in this section, see *Kaspersky Security Center Help*.
6. Click **Save**.

The newly configured group task settings are saved.

## Configuring Activation of the Application task in Web Plug-in

*To configure an Activation of the Application task:*

1. In the main window of the Web Console, select **Devices** → **Tasks**.
2. Click the task name in the list of Kaspersky Security Center tasks.  
The <Task name> window opens.
3. In the **Common** section, specify the key file that you want to use to activate the application. Select the **Use as additional key** check box if you want to add a key to extend the license.
4. Configure the task schedule in the **Schedule** section.
5. In the <Task name> window, click **OK**.

## Configuring Update tasks in Web Plug-in

*To configure the Copying Updates, Database Update, or Software Modules Update tasks:*

1. In the main window of the Web Console, select **Devices** → **Tasks**.
2. Click the task name in the list of Kaspersky Security Center tasks.  
The <Task name> window opens.
3. In the **Update sources** section, configure update source settings:
  - In the **Database update source** section, specify Kaspersky Security Center Administration Server or Kaspersky update servers as an application update source. You can also create a customized list of update sources: by adding custom HTTP and FTP servers or network folders manually, and setting them as update sources.  
You can specify the usage of Kaspersky update servers, if manually customized servers are not available.

To use an SMB-shared folder as an update source, you need to [specify a user account to start a task](#).

When configuring an update task via the Cloud Console, only **Distribution points** and **Kaspersky update servers** settings are available to specify the update source.

  - In the **Connection settings** section, configure the use of a proxy server for connecting to Kaspersky update servers and other servers.
4. In the **Optimization** section for the Database Update task, you can configure the feature that reduces the workload on the disk subsystem:
  - [Disk I/O usage optimization](#)
  - [RAM used for optimization \(400 - 9999 MB\)](#)
5. Configure the task schedule in the **Schedule** section (you can configure a schedule for all task types except Rollback of Database Update).
6. In the <Task name> window, click **OK**.

## Configuring Malfunction diagnosis settings in Web Plug-in

If a problem occurs during operation of Kaspersky Embedded Systems Security (for example, Kaspersky Embedded Systems Security crashes), you can diagnose it. To do so, you can enable the creation of trace files and a dump file for the Kaspersky Embedded Systems Security process and send these files for analysis to Kaspersky Technical Support.

Kaspersky Embedded Systems Security does not send any trace or dump files automatically. Diagnostic data can only be sent by a user who has the required permissions.

Kaspersky Embedded Systems Security writes information to trace files and the dump file in unencrypted form. The folder where files are saved is selected by the user and managed by the operating system configuration and Kaspersky Embedded Systems Security settings. You can configure access permissions and allow only required users to access logs, trace files and dump files.

*To configure the Malfunction diagnosis settings in Kaspersky Security Center:*

1. In the Kaspersky Security Center Administration Console, open the [Application settings](#) window.
2. Open the **Malfunction diagnosis** section.
3. If you want the application to write debug information to a file, in the **Troubleshooting settings** subsection, select the **Enable tracing** check box.
4. In the **Trace files folder** field, specify the absolute path to a local folder where Kaspersky Embedded Systems Security will save trace files.  
The folder must be created beforehand and must be available for writing for SYSTEM account. You cannot specify a network folder, a drive, and environment variables.
5. Configure [the level of details of debug information](#).
6. Specify the **Maximum size of a trace file (MB)**.  
Available values: from 1 to 4095 MB. By default, the maximum size of trace files is set to 50 MB.
7. If you want the application to remove the oldest files after the maximum number of trace files is reached, select the **Remove the oldest trace files** check box.
8. Specify the **Maximum number of files for one trace log**.  
Available values: from 1 to 999. By default, the maximum number of files is set to 5. The field is available only if the **Remove the oldest trace files** check box is selected.
9. If you want the application to create a dump file, select the **Create dump file** check box.
10. In the **Dump files folder** field, specify the absolute path to a local folder where Kaspersky Embedded Systems Security will save the dump file.  
The folder must be created beforehand and must be available for writing for SYSTEM account. You cannot specify a network folder, a drive, and environment variables.
11. Click **OK**.

The configured application settings are applied on the protected device.

## Managing task schedules

You can configure the start schedule for Kaspersky Embedded Systems Security tasks, and configure settings for running tasks on a schedule.

## Scheduling tasks

You can schedule local system and custom tasks in the Application Console. You cannot schedule group tasks in the Application Console.

*To schedule group tasks using the Web Plug-in:*

1. In the main window of the Web Console, select **Devices** → **Tasks**.
2. Click the task name in the list of Kaspersky Security Center tasks.  
The <Task name> window opens.
3. Select the **Application settings** section.
4. In the **Schedule** section, select the **Run by schedule** check box.

Fields with schedule settings for the On-Demand Scan and Update tasks are unavailable if scheduling of these tasks is blocked by a Kaspersky Security Center policy.

5. Configure schedule settings in accordance with your requirements. To do this, perform the following actions:
  - a. In the **Frequency** list, select one of the following values:
    - **Hourly**, if you want the task to run at intervals of a specified number of hours; specify the number of hours in the **Every <number> hour(s)** field.
    - **Daily**, if you want the task to run at intervals of a specified number of days; specify the number of days in the **Every <number> day(s)** field.
    - **Weekly**, if you want the task to run at intervals of a specified number of weeks; specify the number of weeks in the **Every <number> week(s)** field. Specify the days of the week on which the task will be started (by default tasks run on Mondays).
    - **At application launch**, if you want the task to run every time Kaspersky Embedded Systems Security starts.
    - **After application database update**, if you want the task to run after every update of the application databases.
  - b. Specify the time for the first task start in the **Start time** field.
  - c. In the **Start date** field, specify the date when the schedule starts.

6. In the **Task stop settings** section:

- a. Select the **Duration** check box and, in the fields to the right, enter the maximum number of hours and minutes of task execution.
- b. Select the **Pause task** check box and, in the fields to the right, enter the start and end values of a time interval under 24 hours during which task execution will be paused.

7. In the **Advanced schedule settings** section:

- a. Select the **Cancel schedule** check box and specify the date from which the schedule will cease to apply.
- b. Select the **Run skipped tasks** check box to enable the start of skipped tasks.
- c. Select the **Randomize the task start time within the interval** check box and specify a value in minutes.

8. Click the **Save** button to save the task start settings.

## Enabling and disabling scheduled tasks

You can enable and disable scheduled tasks either before or after configuring the schedule settings.

*To enable or disable the task start schedule:*

1. In the main window of the Web Console, select **Devices** → **Tasks**.
2. Click the task name in the list of Kaspersky Security Center tasks.  
The **<Task name>** window opens.
3. Select the **Application settings** section.
4. Select the **Schedule** section.
5. Do one of the following:
  - Select the **Run by schedule** check box if you want to enable scheduled task start.
  - Clear the **Run by schedule** check box if you want to disable scheduled task start.

The configured task start schedule settings are not deleted and will be applied at the next scheduled start of the task.

6. Click **Save**.

The configured task start schedule settings are saved.

## Reports in Kaspersky Security Center

Reports in Kaspersky Security Center contain information about the status of managed devices. Reports are based on information stored on Administration Server.

Starting from Kaspersky Security Center 11, the following types of reports are available for Kaspersky Embedded Systems Security:

- Report on the status of application components
- Report on prohibited applications
- Report on prohibited applications in test mode

See *Kaspersky Security Center Help* for detailed information about all Kaspersky Security Center reports and how to configure them.

## Report on the status of Kaspersky Embedded Systems Security components

You can monitor the protection status of all network devices and get a structured overview of the set of components on each device.

The report displays one of the following states for each component: *Running*, *Paused*, *Stopped*, *Malfunction*, *Not installed*, *Starting*.

*Not Installed* status refers to the component, not the application itself. If the application is not installed, the Kaspersky Security Center Web Console assigns the N/A (Not available) status.

You can create component selections and use filtering to display network devices with a specified set of components and state.

See *Kaspersky Security Center Help* for detailed information about creating and using selections.

To review the status of components in the application settings:

1. In the main window of the Web Console, select **Devices** → **Managed devices**.
2. Click the protected device name.
3. On the **General** tab, select the **Components** section.
4. Review the status table.

Information about Exploit Prevention component status is not available in this table.

To review a Kaspersky Security Center Web Console standard report:

1. Select **Monitoring and Reporting** → **Reports**.
2. Select the **Report on the status of application components** list item and click the **Show report** button.  
A report is generated.
3. Review the following report details:

- A graphical diagram.
- A summary table of components and aggregated numbers of network devices where each of the components is installed, and groups they belong to.
- A detailed table specifying the component status, version, device and group.

## Reports on prohibited applications in active and test modes

Based on the results of the Applications Launch Control task, two types of reports can be generated: a report on prohibited applications (if the task is started in Active mode) and a report on prohibited applications in test mode (if the task is started in Statistics only mode). These reports display information about blocked applications on the protected devices of the network. Each report is generated for all administration groups and accumulates data from all the Kaspersky applications installed on the protected devices.

*To review a report on prohibited applications in Statistics only mode:*

1. Start the Applications Launch Control task in [Statistics only mode](#).
2. Select **Monitoring and Reporting** → **Reports**.
3. Select the **Report on prohibited applications in test mode** list item and click the **Show report** button.  
A report is generated.
4. Review the following report details:
  - A graphical diagram that displays the top 10 applications with the largest number of blocked starts.
  - A summary table of application blocks, specifying the executable file name, reason, time of blocking, and number of devices where the blocking occurred.
  - A detailed table specifying data about the device, file path and criteria for blocking.

*To review a report on prohibited applications in Active mode:*

1. Start the Applications Launch Control task in [Active mode](#).
2. Select **Monitoring and Reporting** → **Reports**.
3. Select the **Report on prohibited applications in test mode** list item and click the **Show report** button.  
A report is generated.

This report consists of the same data about blocks as the report on prohibited applications in test mode.

# Compact Diagnostic Interface

This section describes how to use the Compact Diagnostic Interface for reviewing protected device status or current activity, and how to configure writing of dump and trace files.

## About the Compact Diagnostic Interface

The Compact Diagnostic Interface component (also referred to as the "CDI") is installed and uninstalled along with the System Tray Icon component independently from the Application Console, and can be used when the Application Console is not installed on the protected device. The CDI is started from the System Tray Icon or by running kavfsmui.exe from the application folder on the protected device.

From the CDI window, you can do the following:

- [Review information about general application status.](#)
- [Review security incidents that have occurred.](#)
- [Review current activity on the protected device.](#)
- [Start or stop writing dump and trace files.](#)
- Open the Application Console.
- Open the **About the application** window with the list of installed updates and available patches.

The CDI is available even if access to Kaspersky Embedded Systems Security functions is password-protected. No password is required.

The CDI component cannot be configured via Kaspersky Security Center.

## Reviewing the Kaspersky Embedded Systems Security status via the Compact Diagnostic Interface

To open the Compact Diagnostic Interface window, perform the following actions:

1. Right-click the Kaspersky Embedded Systems Security System Tray Icon in the toolbar notification area.
2. Select the **Open Compact Diagnostic Interface** option.

The **Compact diagnostic interface** window opens.

Review the current status of the key, Real-Time Computer Protection tasks, and Update tasks on the **Protection status** tab. Different colors are used to notify the user about the protection status (see the table below).

Compact Diagnostic Interface protection status.

Section	Status
Real-time	The panel is <i>green</i> for either of the following scenarios (if any of the conditions are

<p><b>protection status</b></p>	<p>met):</p> <ul style="list-style-type: none"> <li>• Recommended configuration: <ul style="list-style-type: none"> <li>• The Real-Time File Protection task is started with the default settings.</li> <li>• The Applications Launch Control task is started in <b>Active</b> mode with the default settings.</li> </ul> </li> <li>• Acceptable configuration: <ul style="list-style-type: none"> <li>• The Real-Time File Protection task is configured by the user.</li> <li>• Applications Launch Control task settings are modified.</li> </ul> </li> </ul> <hr/> <p>The panel is <i>yellow</i> if one or more of the following conditions are met:</p> <ul style="list-style-type: none"> <li>• The Real-Time File Protection task is paused (by the user or schedule).</li> <li>• The Applications Launch Control task is started in <b>Statistics only</b> mode.</li> <li>• Exploit Protection and Applications Launch Control are started in <b>Statistics only</b> mode.</li> </ul> <hr/> <p>The panel is <i>red</i> if both of the following conditions are met:</p> <ul style="list-style-type: none"> <li>• The Real-Time File Protection component is not installed or the task is stopped or paused.</li> <li>• The Applications Launch Control component is not installed or the task is started in <b>Statistics only</b> mode.</li> </ul>
<p><b>Licensing</b></p>	<p>The panel is <i>green</i> if the current license is valid.</p> <hr/> <p>A <i>yellow</i> panel signifies that one of the following events has occurred:</p> <ul style="list-style-type: none"> <li>• <i>Checking the license status.</i></li> <li>• <i>The license will expire in 14 days and no additional key or activation code has been added.</i></li> <li>• <i>The added key has been added to the denylist and is about to be blocked.</i></li> </ul> <hr/> <p>A <i>red</i> panel signifies that one of the following events has occurred:</p> <ul style="list-style-type: none"> <li>• <i>Application not activated</i></li> <li>• <i>License has expired</i></li> <li>• <i>End User License Agreement has been violated</i></li> <li>• <i>Key is in denylist</i></li> </ul>
<p><b>Update</b></p>	<p>The panel is <i>green</i> when Application databases are up-to-date.</p> <hr/> <p>The panel is <i>yellow</i> when Application databases are out of date.</p> <hr/> <p>The panel is <i>red</i> when Application databases are extremely out of date.</p>

## Reviewing security event statistics

The **Statistics** tab displays all security events. Each protection task statistic is displayed in a separate block specifying the number of incidents and the date, and time when the last incident occurred. When an incident is logged, the block color changes to red.

*To review the statistics:*

1. Right-click the Kaspersky Embedded Systems Security System Tray Icon in the toolbar notification area.
2. Select the **Open Compact Diagnostic Interface** option.  
The **Compact diagnostic interface** window opens.
3. Open the **Statistics** tab.
4. Review the security incidents for the protection tasks.

## Reviewing current application activity

On this tab, you can review the status of current tasks and application processes, and promptly get notifications about critical events that occur.

Different colors are used to indicate the application activity status:

- In the **Tasks** section:
  - *Green*. There are no conditions that would require yellow or red.
  - *Yellow*. Critical areas have not been scanned for a long time.
  - *Red*. At least one of the following conditions is true:
    - No tasks are started and a start schedule is not set up for any of the tasks.
    - Application launch errors are logged as critical events.
- In the **Kaspersky Security Network** section:
  - *Green*. The KSN Usage task is started.
  - *Yellow*. The KSN Statement is accepted, but the task is not started.

*To review the current application activity on the protected device:*

1. Right-click the Kaspersky Embedded Systems Security System Tray Icon in the toolbar notification area.
2. Select the **Open Compact Diagnostic Interface** option.  
The **Compact diagnostic interface** window opens.
3. Open the **Current application activity** tab.

4. Review the following information in the **Tasks** section:

- **Critical areas not scanned for a long time**

This field is displayed only if the application returns a corresponding warning about critical area scans.

- **Running now**
- **Execution failed**
- **Next start defined by a schedule**

5. Review the following information in the **Kaspersky Security Network** section:

- **KSN is on. File reputation services are enabled or Protection is off.**
- **[KSN is on. File reputation services are enabled, application statistics is being sent to KSN](#)** 

The application sends information about malware, including fraudulent software, detected during execution of the Real-Time File Protection task and the On-Demand Scan tasks, as well as debugging information about errors during scanning.

The field is displayed if the **Send Kaspersky Security Network statistics** check box is selected in the KSN Usage task settings.

6. Review the following information in the **Integration with Kaspersky Security Center** section:

- **Local management is allowed.**
- **Policy is applied: <Administration Server name>.**

## Configuring writing of dump and trace files

You can configure the writing of dump and trace files via the CDI.

You can also [configure malfunction diagnosis via the Application Console](#).

*To start writing dump and trace files, perform the following actions:*

1. Right-click the Kaspersky Embedded Systems Security System Tray Icon in the toolbar notification area.
2. Select the **Open Compact Diagnostic Interface** option.  
The **Compact diagnostic interface** window opens.
3. Open the **Troubleshooting** tab.
4. Change the following trace settings if necessary:
  - a. Select the **Enable tracing** check box.

b. Click the **Browse** button to specify the folder where Kaspersky Embedded Systems Security will save trace files.

Tracing will be enabled for all components with the default parameters using the *Debug* level of details and the default maximum log size of 50 MB.

5. Change the following dump-file settings if necessary:

a. Select the **Create dump file on malfunction in this folder** check box.

b. Click the **Browse** button to specify the folder where Kaspersky Embedded Systems Security will save the dump file.

6. Click the **Apply** button.

The new configuration will be applied.

# Updating Kaspersky Embedded Systems Security databases and software modules

This section provides information about Kaspersky Embedded Systems Security databases and software module update tasks, copying updates and rolling back database updates of Kaspersky Embedded Systems Security, as well as instructions on how to configure database and software module update tasks.

Updates functionality (including providing anti-virus signature updates and codebase updates), as well as KSN functionality may not be available in the software in the U.S.

## About Update tasks

Kaspersky Embedded Systems Security provides four system update tasks: Database Update, Software Modules Update, Copying Updates, and Rollback of Database Update.

By default, Kaspersky Embedded Systems Security connects to the update source (one of Kaspersky's update protected devices) every hour. You can configure all [Update tasks](#), except for the Rollback of Database Update task. When task settings are modified, Kaspersky Embedded Systems Security will apply the new values at the next task start.

You are not allowed to pause and resume Update tasks.

### Database Update

By default, Kaspersky Embedded Systems Security copies databases from the update source to the device and immediately starts using them in the running Real-Time Computer Protection task. The On-Demand Scan tasks start using the updated database at the next start.

By default, Kaspersky Embedded Systems Security runs the Database Update task every hour.

### Software Modules Update

By default, Kaspersky Embedded Systems Security checks whether software module updates are available on the update source. In order to start using installed software modules, a protected device restart and / or a restart of Kaspersky Embedded Systems Security is required.

By default, Kaspersky Embedded Systems Security runs the Software Modules Update task on a weekly basis on Fridays at 4:00 PM (according to the regional time settings of the protected device). During task execution, the application checks for availability of important and scheduled updates of Kaspersky Embedded Systems Security modules without distributing them.

### Copying Updates

By default, during task execution, Kaspersky Embedded Systems Security downloads Database Update files and saves them to the specified network or local folder without applying them.

The Copying Updates task is disabled by default.

## Rollback of Database Update

During task execution, Kaspersky Embedded Systems Security returns to using databases from previously installed updates.

The Rollback of Database Update task is disabled by default.

## About Software Modules Update

Kaspersky can issue update packages for Kaspersky Embedded Systems Security modules. The update packages can be *urgent* (or *critical*) or planned. Critical update packages repair vulnerabilities and errors; planned packages add new features or enhance existing features.

Urgent (critical) update packages are uploaded to Kaspersky's update servers. Their automatic installation can be configured using the Software Modules Update task. By default, Kaspersky Embedded Systems Security runs the Software Modules Update task on a weekly basis on Fridays at 4:00 PM (according to the regional time settings of the protected device).

Kaspersky does not publish planned update packages on its update servers for automatic update; these can be downloaded from the Kaspersky website. The Software Modules Update task can be used to receive information about the release of scheduled Kaspersky Embedded Systems Security updates.

Critical updates can be retrieved from the Internet and applied to each protected device, or one protected device can be used as an intermediary by copying all updates onto it and then distributing them to the network protected devices. In order to copy and save updates without installing them, use the Copying Updates task.

Before updates of modules are installed, Kaspersky Embedded Systems Security creates backup copies of the previously installed modules. If the software module update process is interrupted or results in an error, Kaspersky Embedded Systems Security will automatically return to using the previously installed software modules. Software modules can be rolled back manually to the previously installed updates.

During the installation of downloaded updates, the Kaspersky Security Service automatically stops and then restarts.

## About Database Update

Kaspersky Embedded Systems Security databases stored on the protected device quickly become outdated. Kaspersky's virus analysts detect hundreds of new threats daily, create identifying records for them, and include them in application database updates. Database updates are a file or set of files containing records that identify threats discovered during the time since the last update was created. To maintain the required level of device protection, we recommend that database updates are received regularly.

By default, if the Kaspersky Embedded Systems Security databases are not updated within a week from the time that the installed database updates were created, the *Application database is out of date* event occurs. If the databases are not updated for a period of two weeks, the *Application database is extremely out of date* event occurs. Information about the [up-to-date status of the databases](#) is displayed in the results pane of the **Kaspersky Embedded Systems Security** node of the Application Console tree. You can use Kaspersky Embedded Systems Security general settings to indicate a different number of days before these events occur. You can also configure [administrator notifications about these events](#).

Kaspersky Embedded Systems Security downloads updates of application databases and modules from Kaspersky's FTP or HTTP update servers, Kaspersky Security Center Administration Server, or other update sources.

Updates can be downloaded to every protected device, or one protected device can be used as an intermediary by copying all updates onto it and then distributing them to the protected devices. If you use Kaspersky Security Center for centralized administration of device protection in an organization, you can use Kaspersky Security Center Administration Server as an intermediary for downloading updates.

Database Update tasks can be started manually or based on a [schedule](#). By default, Kaspersky Embedded Systems Security runs the Database Update task every hour.

If the update download process is interrupted or results in an error Kaspersky Embedded Systems Security will automatically switch back to using the databases from the last installed updates. If the Kaspersky Embedded Systems Security databases become corrupted, they can be [manually rolled back](#) to previously installed updates.

## Schemes for updating anti-virus application databases and modules used within an organization

Selection of an update source in update tasks depends on the scheme used for updating databases and program modules in the organization.

Kaspersky Embedded Systems Security databases and modules can be updated on the protected devices using the following schemes:

- Download updates directly from the Internet to each protected device (Scheme 1).
- Download updates from the Internet to an intermediate device and distribute updates to protected devices from that device.

Any device with the software listed below installed can serve as an intermediate device:

- Kaspersky Embedded Systems Security (Scheme 2).
- Kaspersky Security Center Administration Server (Scheme 3).

Updating using an intermediate device not only reduces Internet traffic, but also provides additional network protected device security.

The update schemes listed are described below.

### Scheme 1. Updating databases and modules directly from the Internet

*To configure Kaspersky Embedded Systems Security updates directly from the Internet:*

on each protected device in the settings of the Database Update task and the Software Modules Update task, specify Kaspersky's update servers as the source of updates.

Other HTTP or FTP servers that have an update folder can be configured as the update source.

Figure 1: Updating databases and modules directly from the Internet

## Scheme 2. Updating databases and modules via one of the protected devices

To configure Kaspersky Embedded Systems Security updates via one of the protected devices:

1. Copy updates to the selected protected device. To do this, perform the following actions:
  - Configure the Copying Updates task settings on the selected protected device:
    - a. Specify Kaspersky's update server as the update source.
    - b. Specify a shared folder to be used as the folder where updates are saved.
2. Distribute updates to other protected devices. To do this, perform the following actions:
  - On each protected device, configure the settings for the Database Update task and the Software Modules Update task (see the figure below):
    - a. For the update source, specify a folder on the intermediate device's drive to which updates will be downloaded.

Kaspersky Embedded Systems Security will obtain updates via one of the protected devices.

Figure 2: Updating databases and modules via one of the protected devices

## Scheme 3. Updating databases and modules via Kaspersky Security Center Administration Server

If Kaspersky Security Center is used for centralized administration of anti-virus device protection, updates can be downloaded via the Kaspersky Security Center Administration Server installed in the local area network (see the figure below).

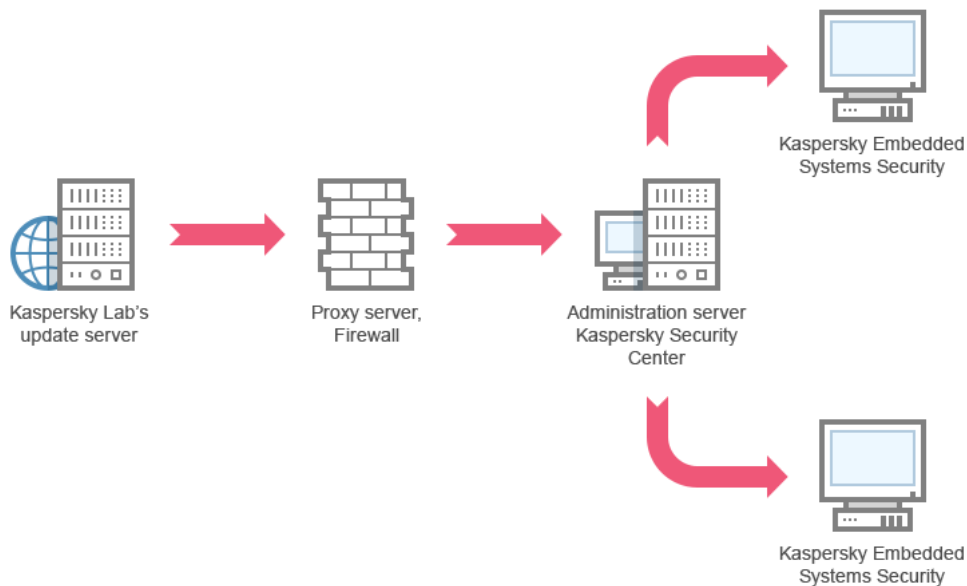

Figure 3: Updating databases and modules via Kaspersky Security Center Administration Server

To configure Kaspersky Embedded Systems Security updates via the Kaspersky Security Center Administration Server:

1. Download updates from Kaspersky's update servers to Kaspersky Security Center Administration Server. To do this, perform the following actions:
  - Configure the Retrieve Updates by Administration Server task for the specified set of protected devices:
    - a. Specify Kaspersky's update servers as the update source.
2. Distribute updates to protected devices. To do so, perform one of the following actions:
  - On the Kaspersky Security Center configure an Anti-Virus database (application module) update group task to distribute updates to protected devices:
    - a. In the task schedule specify **After Administration Server has retrieved updates** as the start frequency. Administration Server will start the task each time it receives updates (recommended method).

The **After Administration Server has retrieved updates** start frequency cannot be specified in the Application Console.

- On each protected device, configure the Database Update task and the Software Modules Update task:
  - a. Specify the Kaspersky Security Center Administration Server as the update source.
  - b. Configure the task schedule if necessary.

If Kaspersky Embedded Systems Security anti-virus databases are rarely updated (from once a month to once a year), the likelihood of detecting threats decreases and the frequency of false alarms raised by application components increases.

Kaspersky Embedded Systems Security will obtain updates via the Kaspersky Security Center Administration Server.

If you plan to use Kaspersky Security Center Administration Server to distribute updates, install Network Agent (an application component included in the Kaspersky Security Center distribution kit) on each of the protected devices. This ensures interaction between the Administration Server and Kaspersky Embedded Systems Security on the protected device. Detailed information about Network Agent and its configuration using Kaspersky Security Center is provided in the *Kaspersky Security Center Help*.

## Configuring Update tasks

This section provides instructions on how to configure Kaspersky Embedded Systems Security update tasks.

## Configuring settings for working with Kaspersky Embedded Systems Security update sources

For each update task except the Rollback of Database Update task, you can specify one or more update sources, add user-defined update sources, and configure the settings for connecting to the specified sources.

After update task settings are modified, the new settings will not be immediately applied in running update tasks. The configured settings will be applied only when the task is restarted.

*To specify the type of update source:*

1. In the Application Console tree, expand the **Update** node.
2. Select the child node corresponding to the update task that you want to configure.
3. Click the **Properties** link in the results pane of the selected node.  
The **Task settings** window opens on the **General** tab.
4. In the **Update source** section, select the type of Kaspersky Embedded Systems Security update source:
  - [Kaspersky Security Center Administration Server](#)
  - [Kaspersky update servers](#)
  - [Custom HTTP or FTP servers, or network folders](#)
5. If required, configure the advanced settings for user-defined update sources:
  - a. Click on the **Custom HTTP or FTP servers, or network folders** link.
    1. In the **Update servers** window that opens, select or clear the check boxes next to user-defined update sources in order to start or stop using them.
    2. Click **OK**.
  - b. In the **Update source** section on the **General** tab, select or clear the [Use Kaspersky update servers if specified servers are not available](#) check box.
6. In the **Task settings** window, select the **Connection settings** tab to configure the settings for connecting to update sources:

- Clear or select the [Use proxy server settings to connect to Kaspersky update servers](#)  check box.
- Clear or select the [Use proxy server settings to connect to other servers](#)  check box.

For information about configuring the optional proxy server settings and authentication settings for accessing the proxy server, see [Starting and configuring Kaspersky Embedded Systems Security Database Update task](#) section.

7. Click **OK**.

The configured settings for the Kaspersky Embedded Systems Security update source will be saved and applied at the next task start.

You can manage the list of user-defined Kaspersky Embedded Systems Security update sources.

*To edit the list of user-defined application update sources:*

1. In the Application Console tree, expand the **Update** node.
2. Select the child node corresponding to the update task that you want to configure.
3. Click the **Properties** link in the results pane of the selected node.  
The **Task settings** window opens on the **General** tab.
4. Click on the **Custom HTTP or FTP servers, or network folders** link.  
The **Update servers** window opens.
5. Do the following:
  - To add a new user-defined update source, click **Add** and in the entry field specify the address of the folder containing update files on the FTP or HTTP server. Specify a local or network folder in the UNC (Universal Naming Convention) format. Press **ENTER**.  
By default, the added folder is used as the source of updates.
  - To disable use of a user-defined source, clear the check box next to the source in the list.
  - To enable use of a user-defined source, select the check box next to the source in the list.
  - In order to change the order in which Kaspersky Embedded Systems Security accesses user-defined update sources, use the **Move up** and **Move down** buttons to move the selected source toward the beginning or end of the list, depending on whether it is to be used before or after other sources.
  - To change the path to a user-defined source, select the source in the list and click the **Edit** button, make the required changes in the entry field, and press the **ENTER** key.
  - To remove a user-defined source, select it in the list and click the **Remove** button.

You cannot delete the only remaining user-defined source from the list.

6. Click **OK**.

The changes in the list of user-defined application update sources will be saved.

## Optimizing disk I/O when running the Database Update task

When running the Database Update task, Kaspersky Embedded Systems Security stores update files on the protected device's local disk. You can lower the workload on the protected device's disk I/O subsystem by storing update files on a virtual drive in RAM when running the update task.

This feature is available for Microsoft Windows 7 operating systems and higher.

When using this feature while running the Database Update task, an extra logical drive may appear in the operating system. This logical drive will be removed from the operating system after the task is completed.

*To lower the workload on your protected devices's disk I/O subsystem during the Database Update task:*

1. In the Application Console tree, expand the **Update** node.
2. Select the **Database Update** child node.
3. Click the **Properties** link in the results pane of the **Database Update** node.  
The **Task settings** window opens on the **General** tab.
4. In the **Disk I/O usage optimization** section, define the following settings:

- Clear or select the [Lower the load on the disk I/O](#) check box.
- In the **RAM used for optimization, MB** field, specify the RAM volume (in MB). The operating system temporarily allocates the specified RAM volume to store update files while running the task. The default RAM size is 512 MB. The minimum RAM size is 400 MB.

When running the Database Update task with the disk subsystem optimization feature enabled, one of the following may occur, depending on the amount of RAM allocated for the feature:

- If the value is too small, the allocated amount of RAM might be insufficient to complete the database update task (for example, during the first update), which will lead to the completion of the task with an error.  
In this case, it is recommended to allocate more RAM for the disk subsystem optimization feature.
- If the value is too large, at the start of the Database Update task, it might be impossible to create a virtual drive of a selected size in RAM. As a result, the disk subsystem optimization feature automatically disables, and the Database Update task runs without the optimization feature.  
In this case, it is recommended to allocate less RAM for the disk subsystem optimization feature.

5. Click **OK**.

The configured settings will be saved and applied at the next task start.

## Configuring Copying Updates task settings

*To configure the Copying Updates task:*

1. In the Application Console tree, expand the **Update** node.
2. Select the **Copying Updates** child node.
3. Click the **Properties** link in the results pane of the **Copying Updates** node.  
The **Task settings** window opens.
4. On the **General** and **Connection settings** tabs, configure the settings for working with [update sources](#).
5. On the **General** tab in the **Copying updates settings** section:
  - Specify the conditions for copying updates:
    - [Copy database updates](#)
    - [Copy critical software modules updates](#)
    - [Copy database updates and critical software modules updates](#)
  - Specify the local or network folder to which Kaspersky Embedded Systems Security will be distributing downloaded updates.
6. On the **Schedule** and **Advanced** tabs configure the [task start schedule](#).
7. On the **Run as** tab, configure the task to start using [a specific user account](#).
8. Click **OK**.

The configured settings will be saved and applied at the next task start.

## Configuring Software Modules Update task settings

*To configure the Software Modules Update task:*

1. In the Application Console tree, expand the **Update** node.
2. Select the **Software Modules Update** child node.
3. Click the **Properties** link in the results pane of the **Software Modules Update** node.  
The **Task settings** window opens.
4. On the **General** and **Connection settings** tabs, configure the settings for working with [update sources](#).
5. On the **General** tab in the **Update settings** section, configure the settings for updating application modules:
  - [Only check for available critical software modules updates](#)
  - [Copy and install critical software modules updates](#)
  - [Allow operating system restart](#)
  - [Receive information about available scheduled software modules updates](#)

6. On the **Schedule** and **Advanced** tabs, configure the [task start schedule](#). By default, Kaspersky Embedded Systems Security runs the Software Modules Update task on a weekly basis on Fridays at 4:00 PM (according to the regional time settings of the protected device).
7. On the **Run as** tab, configure the task to start using [a specific user account](#).
8. Click **OK**.

The configured settings will be saved and applied at the next task start.

Kaspersky does not publish planned update packages on the update servers for automatic installation; these can be downloaded manually from the Kaspersky website. You can configure administrator notification about the *New critical and scheduled updates are available* event; the notification will contain the URL of the web page where scheduled updates can be downloaded.

## Rolling back Kaspersky Embedded Systems Security database updates

Before database updates are performed, Kaspersky Embedded Systems Security creates backup copies of the previously used databases. If an update is interrupted or results in an error, Kaspersky Embedded Systems Security will automatically return to using the previously installed databases.

If any problems arise after you have updated the databases, you can roll back to the previously installed updates through the Rollback of Database Update task.

*To start the Rollback of Database Update task:*

In the results pane of the **Rollback of Application Database Update** node, click the **Start** link.

## Rolling back application module updates

The names of settings may vary under different Windows operating systems.

Before applying software module updates, Kaspersky Embedded Systems Security creates backup copies of the modules currently in use. If the module update process is interrupted or results in an error, Kaspersky Embedded Systems Security will automatically return to using modules from the latest installed updates.

In order to roll back software modules, use the **Install and delete applications** feature in Microsoft Windows.

## Update task statistics

While the update task is running, the real-time information is displayed about the amount of data downloaded since the task started, as well as other task execution statistics.

When the task is complete or stopped, the information is available in the task log.

*To view update task statistics:*

1. In the Application Console tree, expand the **Update** node.

2. Select the child node that corresponds to the task whose statistics you want to view.

Task statistics are displayed in the **Statistics** section of the results pane of the selected node.

If you are viewing/ the Database Update task or the Copying Updates task, the **Statistics** section shows the volume of data downloaded by Kaspersky Embedded Systems Security as of the present moment (**Received data**).

The following table contains the details for the Software Modules Update task.

Information about the Software Modules Update task

Field	Description
<b>Received data</b>	Total amount of downloaded data.
<b>Available critical updates</b>	Number of critical updates available for installation.
<b>Available scheduled updates</b>	Number of planned updates available for installation.
<b>Errors applying updates</b>	If the value of this field is non-zero, the update was not applied. The name of the update that resulted in an error can be viewed in the <a href="#">task log</a> .

## Isolating objects and copying backups

This section provides information about backing up detected malicious objects before they are disinfected or removed, and information about quarantining probably infected objects.

## Isolating probably infected objects. Quarantine

This section describes how to isolate probably infected objects by quarantining them and how to configure Quarantine settings.

## About quarantining probably infected objects

Kaspersky Embedded Systems Security quarantines probably infected objects by moving such objects from their original location to the *Quarantine* folder. For security purposes, objects in the Quarantine folder are stored in encrypted form.

## Viewing quarantine objects

Quarantined objects can be viewed in the **Quarantine** node of the Application Console.

*To view quarantined objects:*

1. In the Application Console tree, expand the **Storages** node.
2. Select the **Quarantine** child node.

Information about quarantined objects is displayed in the results pane of the selected node.

*To find the required object in the list of quarantined objects,*

[sort the objects](#) or [filter the objects](#).

## Sorting quarantined objects

By default, objects in the list of quarantined objects are sorted by quarantine date in reverse chronological order. To find the required object you may sort objects by the columns with object information. The sorted results will be saved if you close and then re-open the **Quarantine** node, or if you close the Application Console, save the msc file and then re-open it from this file.

*To sort objects:*

1. In the Application Console tree, expand the **Storages** node.
2. Select the **Quarantine** child node.

3. In the results pane of the **Quarantine** node, select the column heading that you wish to use to sort the objects in the list.

Objects in the list will be sorted based on the selected setting.

## Filtering quarantined objects

To find the required quarantined object, you can filter objects in the list, i.e. display only those objects that satisfy the filtering criteria (filters) that you specify. The filtered results are saved if you close and then reopen the **Quarantine** node or if you close the Application Console, save the msc file and then reopen it from this file.

*To specify one or more filters:*

1. In the Application Console tree, expand the **Storages** node.
2. Select the **Quarantine** child node.
3. Select **Filter** in the context menu of the node's name.  
The **Filter settings** window opens.
4. To add a filter, perform the following steps:
  - a. In the **Field name** list, select the field that will form the basis of the filter.
  - b. In the **Operator** list, select the filtering condition. The filtering conditions in the list may differ depending on the value you selected in the **Field name** list.
  - c. Enter the filter value in the **Field value** field or select it from the list.
  - d. Click the **Add** button.

The filter you have added will appear in the list of filters in the **Filter settings** window. Repeat steps a-d for each filter you add. Use the following guidelines while working with filters:

- To combine multiple filters using the logical operator "AND", select **If all conditions are met**.
  - To combine multiple filters using the logical operator "OR", select **If any condition is met**.
  - To delete a filter, select the filter you wish to delete in the filter list, and click the **Remove** button.
  - To edit a filter, select the filter in the list in the **Filter settings** window. Then change the required values in the **Field name**, **Operator** or **Field value** fields and click the **Replace** button.
5. After all filters have been added, click the **Apply** button.

The created filters will be saved.

*To return to displaying all quarantined objects,*

select **Remove filter** in the context menu of the **Quarantine** node.

## Quarantine Scan

By default, after each database update, Kaspersky Embedded Systems Security performs the Quarantine Scan local system task. The task settings are described in the table below. The Quarantine Scan task settings cannot be modified.

You can configure the [task start schedule](#), start it manually, and modify the [permissions of the account](#) used to start the task.

After scanning quarantined objects following a database update, Kaspersky Embedded Systems Security may reclassify some of them as not infected: the status of such objects is changed to **False alarm**. Other objects may be reclassified as infected, in which case Kaspersky Embedded Systems Security handles such objects as specified by the Quarantine Scan task settings: disinfect, or delete if disinfection failed.

Quarantine Scan task settings

Quarantine Scan task setting	Value
Scan scope	Quarantine folder
Security settings	The same for the entire scan scope; their values are provided in the next table

Scan settings in the Quarantine Scan task

Security setting	Value
Scan objects	All objects included in the scan scope
Performance	Disabled
Action to perform on infected and other objects	Disinfect, delete if disinfection is impossible
Action to perform on probably infected objects	Skip
Exclude files	No
Do not detect	No
Stop scanning if it takes longer than (sec.)	Not configured
Do not scan objects larger than (MB)	Not configured
Scan alternate NTFS streams	Enabled
Scan disk boot sectors and MBR	Disabled
Use iChecker technology	Disabled
Use iSwift technology	Disabled
Scan compound objects	<ul style="list-style-type: none"> <li>• Archives*</li> <li>• SFX archives*</li> <li>• Packed objects*</li> <li>• Embedded OLE objects*</li> </ul> <p>* Scan only new and modified files is disabled.</p>
Check Microsoft signature in files	Not performed
Use heuristic analyzer	Enabled with <b>Deep</b> analysis level
Trusted Zone	Not applied

## Restoring quarantined objects

Kaspersky Embedded Systems Security places probably infected objects into the Quarantine folder in encrypted form to shield the protected device against any possible harmful effects.

You can restore any object from Quarantine. This may be required in the following cases:

- After a Quarantine Scan using an updated database, the status of the object changes to **False alarm** or **Disinfected**.
- You consider the object harmless for the protected device and want to use it. If you do not want Kaspersky Embedded Systems Security to isolate the object during the subsequent scans, you can exclude the object from processing in the Real-Time File Protection task and On-Demand Scan tasks. To do this, specify the object in the **Exclude files** (by filename) or **Do not detect** security setting in those tasks, or add it to the [Trusted Zone](#).

When you restore objects you can select where the object being restored will be saved: the original location (default), special folder for restored objects on the protected device, or custom folder on the protected device where the Application Console is installed or on another device in the network.

You can specify the folder used for storing restored objects on the protected device. You can configure special security settings for it to be scanned. The path to this folder is set by the Quarantine settings.

Restoring objects from Quarantine may lead to protected device infection.

You can restore the object and save a copy of it in the Quarantine folder to use later, for example, to rescan the object after the database has been updated.

If a quarantined object was contained in a compound object (for example, in an archive), Kaspersky Embedded Systems Security will not include the quarantined object into the compound object during the restoration, rather the quarantined object will be saved separately into a selected folder.

You can restore one or more objects.

*To restore quarantined objects, perform the following steps:*

1. In the Application Console tree, expand the **Storages** node.
2. Select the **Quarantine** child node.
3. Perform one of the following actions in the results pane of the **Quarantine** node:
  - To restore one object, select **Restore** from the context menu of the object that you want to restore.
  - To restore multiple objects, select the objects you wish to restore using the **CTRL** or **SHIFT** key, right-click one of the selected objects, and select **Restore** from the context menu.

The **Restore object** window opens.

4. In the **Restore object** window, specify the folder in which the object being restored will be saved for each selected object.

The name of the object is displayed in the **Object** field in the upper part of the window. If you selected several objects, the name of the first object in the list of selected objects will be displayed.

5. Perform one of the following steps:

- To restore an object to its original location, select **Restore to the source folder**.
- To restore an object to the folder specified as the location for restored objects in the settings, select **Restore to the default folder for restoration**.
- To save an object to a different folder on the protected device where the Application Console is installed or to a shared folder, select **Restore to folder on your local computer** and then select the required folder or specify the path to it.

6. If you want to save a copy of the object in the *Quarantine* folder after the object is restored, clear the **Remove objects from storage after they are restored** check box.

7. To apply the specified restoration conditions to the rest of the selected objects, check the **Apply to all selected objects** box.

All selected objects are restored and saved in the specified location. If you selected **Restore to the source folder**, each of the objects will be saved in its original location; if you selected **Restore to the default folder for restoration** or **Restore to folder on your local computer**, all objects will then be saved in one specified folder.

8. Click **OK**.

Kaspersky Embedded Systems Security will start restoring the first of the selected objects.

9. If an object with this name already exists in the specified location, the **Object with this name already exists** window opens.

a. Select one of the following Kaspersky Embedded Systems Security actions:

- **Replace**, to replace the existing object with the restored object.
- **Rename**, to save the restored object under a different name. In the entry field, enter the new restored object's filename and full path.
- **Rename by adding suffix**, to rename the restored object by adding a suffix to its filename. Enter the suffix in the entry field.

b. If you selected several objects to be restored, then select the **Apply to all selected objects** check box to apply the selected action (**Replace** or **Rename**) to the rest of the selected objects. If you selected **Rename**, the **Apply to all selected objects** check box will be unavailable.

c. Click **OK**.

The object will be restored. Information about the restoration operation will be recorded in the system audit log.

If you did not select **Apply to all selected objects** in the **Restore object** window, the **Restore object** window may open again. Use this window to specify the location where the next selected object will be saved (see Step 4 of this procedure).

## Moving objects to Quarantine

You can quarantine files manually.

*To quarantine a file:*

1. In the Application Console tree, open the context menu of the **Quarantine** node.
2. Select **Add**.
3. In the **Open** window, select the file on the disk that you wish to quarantine.
4. Click **OK**.

Kaspersky Embedded Systems Security will quarantine the selected file.

## Deleting objects from Quarantine

Based on the Quarantine Scan task settings, Kaspersky Embedded Systems Security automatically deletes objects from the Quarantine folder if their status changed to *Infected* during a Quarantine Scan with updated databases and if Kaspersky Embedded Systems Security failed to disinfect them. Kaspersky Embedded Systems Security does not remove other objects from Quarantine.

One or more objects can be deleted from Quarantine.

*To delete one or more objects from Quarantine:*

1. In the Application Console tree, expand the **Storages** node.
2. Select the **Quarantine** child node.
3. Perform one of the following steps:
  - To remove one object, select **Remove** in the context menu of the name of the object.
  - To delete multiple objects, select the objects that you want to delete using the **Ctrl** or **Shift** key, open the context menu on any one of the selected objects, and select **Remove**.
4. In the confirmation window, click the **Yes** button to confirm the operation.

The selected objects will be removed from Quarantine.

## Sending probably infected objects to Kaspersky for analysis

If the behavior of a file gives you a reason to suspect that it contains a threat, and Kaspersky Embedded Systems Security considers the file to be clean, you may have encountered an unknown threat whose signature has not yet been added to the databases. You can send this file to Kaspersky for analysis. Kaspersky's Anti-Virus analysts will analyze it and, if they detect a new threat, will add a record identifying it in the databases. When you rescan the object after the database has been updated, it is likely that Kaspersky Embedded Systems Security will identify the object as infected and will be able to disinfect it. You will not only be able to keep the object, but will also prevent a virus outbreak.

Only quarantined files can be sent for analysis. Quarantined files are stored in encrypted form and are not deleted by the Anti-Virus application installed on the mail server when they are sent.

A quarantined object cannot be sent to Kaspersky for analysis after the license expires.

*To send a file for analysis to Kaspersky:*

1. If the file was not quarantined, first move it into **Quarantine**.
2. In the **Quarantine** node, open the context menu on the file you want to send for analysis and select **Send object for analysis** in the context menu.
3. In the confirmation window that opens, click **Yes** if you are sure you want to send the selected object for analysis.
4. If a mail client is configured on the protected device on which the Application Console is installed, a new email message is created. Review it and click the **Send** button.

The **Receiver** field contains the Kaspersky email address `newvirus@kaspersky.com`. The Subject field will contain the text "Quarantined object".

The body of the message will contain the following text: "This file will be sent to Kaspersky for analysis". Any additional information about the file, why you considered it probably infected or dangerous, how it behaves, or how it affects the system, can be included in the body of the message.

An archive named `<object name>.cab` will be attached to the message. This archive will contain a `<uuid>.klq` file with the object in encrypted form, a `<uuid>.txt` file with information about the object extracted by Kaspersky Embedded Systems Security, and a `Sysinfo.txt` file, which contains the following information about Kaspersky Embedded Systems Security and the operation system installed on the protected device:

- Name and version of the operating system.
- Name and version of Kaspersky Embedded Systems Security.
- Release date of the latest database update installed.
- Active key.

This information is required by Kaspersky's anti-virus analysts to analyze your file faster and more efficiently. However, if you do not wish to send this information, you can delete the `Sysinfo.txt` file from the archive.

If a mail client is not installed on the protected device with the Application Console, the application prompts you to save the selected encrypted object to file. This file can be sent to Kaspersky manually.

*To save an encrypted object to a file:*

1. In the window that opens with a prompt to save the object, click **OK**.
2. Select a folder on the drive of the protected device or a network folder where the file containing the object will be saved.

The object will be saved to a CAB file.

## Configuring Quarantine settings

You can configure Quarantine settings. New Quarantine settings are applied immediately after saving.

*To configure Quarantine settings:*

1. In the Application Console tree, expand the **Storages** node.
2. Open the context menu of the **Quarantine** child node.
3. Select **Properties**.
4. In the **Quarantine Properties** window, configure the necessary Quarantine settings in accordance with your requirements:

- In the **Quarantine settings** section:
  - [Quarantine folder](#)
  - [Maximum Quarantine size \(MB\)](#)
  - [Threshold value for space available \(MB\)](#)

If the size of objects in Quarantine exceeds the maximum quarantine size or exceeds the available space threshold, Kaspersky Embedded Systems Security will notify you about this while continuing to place objects in Quarantine.

- In the **Restoration settings** section:
  - [Target folder for restoring objects](#)

5. Click **OK**.

The newly configured Quarantine settings will be saved.

## Quarantine statistics

You can view information about the number of quarantined objects, i.e. quarantine statistics.

*To view quarantine statistics,*

in the context menu of the **Quarantine** node in the Application Console tree, select **Statistics**.

The **Quarantine statistics** window displays information about the number of objects currently stored in Quarantine (see the following table):

Field	Description
<b>Probably infected objects</b>	Number of objects found by Kaspersky Embedded Systems Security to be probably infected.
<b>Used quarantine space</b>	Total amount of data in the Quarantine folder.
<b>False alarms</b>	The number of objects that received <i>False alarm</i> status because they were classified as non-infected during a Quarantine Scan using updated databases.
<b>Objects</b>	The number of objects that received <i>Disinfected</i> status after the Quarantine Scan.

disinfected	
Total number of objects	Total number of objects in Quarantine.

## Making backup copies of objects. Backup

This section provides information about backup of detected malicious objects before disinfection or deletion, as well as instructions for configuring Backup.

### About backing up objects before disinfection or deletion

Kaspersky Embedded Systems Security stores encrypted copies of objects classified as *Infected in Backup* before disinfecting or deleting them.

If the object is a part of a compound object (for example, part of an archive), Kaspersky Embedded Systems Security will save the compound object in its entirety in Backup. For example, if Kaspersky Embedded Systems Security has detected that one of the objects from a mail database is infected, it will back up the entire mail database.

Large objects placed in Backup by Kaspersky Embedded Systems Security can slow down the system and reduce available disk space on the hard drive.

Files can be restored from Backup either to their original folder or to a different folder on the protected device or on another device in the local area network. A file can be restored from Backup, for example, if an infected file contains important information, but Kaspersky Embedded Systems Security is unable to disinfect it without damaging its integrity and losing the information.

Restoring files from Backup may lead to protected device infection.

### Viewing objects stored in Backup

Objects can be viewed in the Backup folder only by using the Application Console in the **Backup** node. They cannot be viewed using Microsoft Windows file managers.

*To view the objects in Backup,*

1. In the Application Console tree, expand the **Storages** node.
2. Select the **Backup** child node.

Information about objects placed in Backup is displayed in the results pane of the selected node.

*To find the necessary object in the list of objects in Backup,*

sort the objects or filter the objects.

## Sorting files in Backup

By default, files in Backup are sorted by the backup date in reverse chronological order. To find the required file, you can sort files according to the content of any column in the results pane.

The sorted results are saved if you close and then reopen the **Backup** node or if you close the Application Console, save the msc file and then reopen it from this file.

*To sort files in Backup:*

1. In the Application Console tree, expand the **Storages** node.
2. Select the **Backup** child node.
3. In the list of files in **Backup**, select the column heading which you want to use to sort the objects.

Files in Backup will be sorted based on the selected criterion.

## Filtering files in Backup

To find the required file in Backup you can filter files: display in the **Backup** node only those files which satisfy the filtering criteria you have specified (filters).

The sorting result will be saved if you close and then re-open the **Backup** node or if you close the Application Console, save the msc file and then re-open it from this file.

*To filter files in Backup:*

1. In the Application Console tree, open the context menu of the **Backup** node and select **Filter**.  
The **Filter settings** window opens.
2. To add a filter, perform the following steps:
  - a. In the **Field name** list, select the field that will form the basis of the filter.
  - b. In the **Operator** list select the filtering condition. The filtering conditions in the list may differ depending on the value you selected in the **Field name** field.
  - c. Enter the filter value in the **Field value** field or select a filter value.
  - d. Click the **Add** button.

The filter you added will appear in the list of filters in the **Filter settings** window. Repeat these steps for each filter you add. The following guidelines can be used while working with filters:

- To combine multiple filters using the logical operator "AND", select **If all conditions are met**.
- To combine multiple filters using the logical operator "OR", select **If any condition is met**.
- To delete a filter, select the filter you wish to delete in the filter list, and click the **Remove** button.

- To edit the filter, select it from the filter list in the **Filter settings** window, modify the required values in the **Field name**, **Operator** or **Field value** fields and click the **Replace** button.

When all filters have been added, click the **Apply** button. Only files that match the filters you have specified will be displayed in the list.

*To display all files included in the list of objects stored in Backup,*

select **Remove filter** in the context menu of the **Backup** node.

## Restoring files from Backup

Kaspersky Embedded Systems Security stores files in the Backup folder in encrypted form to shield the protected device against possible harmful effects.

Any file can be restored from Backup.

A file may need to be restored in the following cases:

- The original infected file contained important information and Kaspersky Embedded Systems Security failed to keep its integrity so, as a result, the information in the file became unavailable.
- You consider the file harmless to the protected device and want to use it. If you do not want Kaspersky Embedded Systems Security to consider this file infected or probably infected, during subsequent scans you can exclude it from processing in the Real-Time File Protection task and On-Demand Scan tasks. To do this, specify the file in the **Exclude files** setting or the **Do not detect** setting in the corresponding tasks.

Restoring files from Backup may lead to protected device infection.

When you restore a file you can select where it will be saved: the original location (default), the special folder for restored objects on the protected device, or a custom folder on the protected device where the Application Console is installed or another device in the network.

You can specify the folder for storing restored objects on the protected device. You can configure special security settings for it to be scanned. The path to this folder is specified by [Backup settings](#).

By default when Kaspersky Embedded Systems Security restores a file, it makes a copy of it in Backup. The file copy can be deleted from Backup after it is restored.

*To restore files from Backup:*

1. In the Application Console tree, expand the **Storages** node.
2. Select the **Backup** child node.
3. Perform one of the following actions in the results pane of the **Backup** node:
  - To restore one object, select **Restore** from the context menu of the object that you want to restore.
  - To restore multiple objects, select the objects you wish to restore using the **CTRL** or **SHIFT** key, right-click one of the selected objects, and select **Restore** from the context menu.

The **Restore object** window opens.

4. In the **Restore object** window, specify the folder in which the object being restored will be saved for each selected object.

The name of the object is displayed in the **Object** field in the upper part of the window. If you selected several objects, the name of the first object in the list of selected objects will be displayed.

5. Perform one of the following steps:

- To restore an object to its original location, select **Restore to the source folder**.
- To restore an object to the folder specified as the location for restored objects in the settings, select **Restore to the default folder for restoration**.
- To save an object to a different folder on the protected device where the Application Console is installed or to a shared folder, select **Restore to folder on your local computer** and then select the required folder or specify the path to it.

6. If you do not want to save a copy of the file in the Backup folder after it is restored, select the **Remove objects from storage after they are restored** check box (by default, this check box is cleared).

7. To apply the specified restoration conditions to the rest of the selected objects, check the **Apply to all selected objects** box.

All selected objects are restored and saved in the specified location. If you selected **Restore to the source folder**, each of the objects will be saved in its original location; if you selected **Restore to the default folder for restoration** or **Restore to folder on your local computer**, all objects will then be saved in one specified folder.

8. Click **OK**.

Kaspersky Embedded Systems Security will start restoring the first of the selected objects.

9. If an object with this name already exists in the specified location, the **Object with this name already exists** window opens.

a. Select one of the following Kaspersky Embedded Systems Security actions:

- **Replace**, to replace the existing object with the restored object.
- **Rename**, to save the restored object under a different name. In the entry field, enter the new restored object's filename and full path.
- **Rename by adding suffix**, to rename the restored object by adding a suffix to its filename. Enter the suffix in the entry field.

b. If you selected several objects to be restored, then select the **Apply to all selected objects** check box to apply the selected action (**Replace** or **Rename**) to the rest of the selected objects. If you selected **Rename**, the **Apply to all selected objects** check box will be unavailable.

c. Click **OK**.

The object will be restored. Information about the restoration operation will be recorded in the system audit log.

If you did not select **Apply to all selected objects** in the **Restore object** window, the **Restore object** window may open again. Use this window to specify the location where the next selected object will be saved (see Step 4 of this procedure).

## Deleting files from Backup

*To delete one or more files from Backup:*

1. In the Application Console tree, expand the **Storages** node.
2. Select the **Backup** child node.
3. Perform one of the following steps:
  - To remove one object, select **Remove** in the context menu of the name of the object.
  - To delete multiple objects, select the objects that you want to delete using the **Ctrl** or **Shift** key, open the context menu on any one of the selected objects, and select **Remove**.
4. In the confirmation window, click the **Yes** button to confirm the operation.

The selected files will be deleted from Backup.

## Configuring Backup settings

*To configure Backup settings:*

1. In the Application Console tree, expand the **Storages** node.
2. Open the context menu of the **Backup** child node.
3. Select **Properties**.
4. In the **Backup Properties** window, configure the necessary Backup settings in accordance with your requirements:

In the **Backup settings** section:

- [Backup folder](#)
- [Maximum Backup size \(MB\)](#)
- [Threshold value for space available \(MB\)](#)

If the size of objects in Backup exceeds the maximum Backup size or exceeds the available space threshold, Kaspersky Embedded Systems Security will notify you about this while continuing to place objects in Backup.

In the **Restoration settings** section:

- [Target folder for restoring objects](#)

5. Click **OK**.

The configured Backup settings will be saved.

## Backup statistics

You can view information about the current status of Backup, i.e. Backup statistics.

*To view Backup statistics,*

open the context menu on the **Backup** node in the Application Console tree and select **Statistics**. The **Backup statistics** window opens.

The **Backup statistics** window displays information about the current Backup status (see the table below).

Information about the current Backup status

Field	Description
<b>Current Backup size</b>	Amount of data in the Backup folder; the application calculates the file size in encrypted form
<b>Total number of objects</b>	Current total number of objects in Backup

## Blocking access to network resources. Blocked network sessions

This section describes how to block remote devices and configure the settings for the List of blocked network sessions.

### About the List of blocked network sessions

By default, the List of blocked network sessions is available for use if any of the following components is installed: Real-Time File Protection, Network Threat Protection. These components discover remote attempts to encrypt, open or execute objects on the protected device or network attached storage shared folders in accordance with the list of blocked network sessions. Information about blocked network sessions from all protected devices is sent to the Kaspersky Security Center. Kaspersky Embedded Systems Security blocks current session and, in terms of current session, makes shared folders or network attached storage folders unavailable.

The List of blocked network sessions is populated when at least one of the following tasks is started in active mode (under specified conditions):

- For the Real-Time File Protection task: malicious activity by a device accessing network file resources is detected and in the Real-Time File Protection task settings the **Block access to network shared resources for the sessions that show malicious activity** check box is selected.
- For the Network Threat Protection task: activity typical of network attacks is detected.

After malicious activity or an encryption attempt is detected, the task sends information about the attacking network session to the List of blocked network sessions and the application creates a *Warning* event for current session of the attacking host. Any attempts by this session to access the protected shared network folders will be blocked.

If the locally unique identifier (LUID) of a host that initiated the attacking network session is added to the List of blocked network sessions, Kaspersky Embedded Systems Security determines the IP address of the host and adds it to the List of blocked network sessions instead of the LUID of the attacking host.

By default, Kaspersky Embedded Systems Security removes blocked network sessions from the list 30 minutes after they were added to the list. Access to network file resources is restored automatically after the network sessions are deleted from the List of blocked network sessions. You can specify the period of time after which blocked network sessions are automatically unblocked.

Note that when you restrict access to storage management for any user account, the List of blocked network sessions will still be available. The settings for blocked network sessions cannot be changed unless the selected user account has **Edit permissions** for managing Kaspersky Embedded Systems Security.

## Managing the List of blocked network sessions via the Administration Plug-in

In this section, learn how to configure the settings for the List of blocked network sessions via the Administration Plug-in interface.

### Enabling untrusted hosts blocking

To add network sessions showing any malicious or encrypting activity to the **List of blocked network sessions** and block access to network file resources, at least one of the following tasks must run in the active mode:

- Real-Time File Protection
- Network Threat Protection

*Configure the Real-Time File Protection task:*

1. In the Kaspersky Security Center Administration Console tree, expand the **Managed devices** node.
2. Select the **Policies** tab and open **<Policy name> >Real-Time Computer Protection > Settings** in the **Real-Time File Protection** block.  
The **Real-Time Computer Protection** window opens.
3. In the **Integration with other components** section, select the **List hosts showing malicious activity as untrusted** check box if you want Kaspersky Embedded Systems Security to block access to network file resources for hosts on which malicious activity is detected while the Real-Time File Protection task is running.
4. If the task has not been started, open the **Task management** tab:
  - a. Select the **Run by schedule** check box.
  - b. Select the **At application launch** frequency in the drop-down list.
5. In the **Real-Time Computer Protection** window, click **OK**.

The newly configured settings are saved.

*Configure the Network Threat Protection task:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Policies** tab.
4. Double-click the policy name you want to configure.
5. In the **Properties: <Policy name>** window that opens, select the section.
6. Click the **Settings** button in the **Network Threat Protection** subsection.  
The **Network Threat Protection** window opens.
7. Open the **General** tab.
8. In the **Processing mode** section select the **[Block connections when attack is detected](#)**  processing mode.

The check box enables or disables adding hosts showing activity typical of network attacks to the list of blocked hosts.

If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, logs events about detected activity, and adds IP addresses of hosts showing activity typical of network attacks to the list of blocked hosts.

The mode is selected by default.

You can view the list of blocked hosts in the [Blocked Hosts storage](#).

You can restore access to blocked hosts, and specify the number of days, hours and minutes after which hosts regain access to network file resources after being blocked by configuring the [Blocked Hosts storage settings](#).

9. If the task has not been started, open the **Task management** tab:
  - a. Select the **Run by schedule** check box.
  - b. Select the **At application launch** frequency in the drop-down list.
10. In the window, click **OK**.
11. The newly configured settings are saved.

## Configuring settings for the List of blocked network sessions

*To configure the List of blocked network sessions:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:

- To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
- To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Supplementary** section, click the **Settings** button in the **Storages** subsection.

The **Storages settings** window is displayed.

5. In the **Network session blocking terms** section of the **Blocked Network Sessions** tab, specify the number of days, hours and minutes after which blocked network sessions regain access to network file resources after being blocked.

6. Click **OK**.

## Managing the List of blocked network sessions via the Application Console

In this section, learn how to configure the settings of the List of blocked network sessions via the Application Console interface.

### Enabling untrusted hosts blocking

To add network sessions showing any malicious or encryption activity to the **List of blocked network sessions** and block access to network file resources, at least one of the following tasks must be running in active mode:

- Real-Time File Protection
- Network Threat Protection

*Configure the Real-Time File Protection task:*

1. In the Application Console tree, expand the **Real-Time Computer Protection** node.

2. Select the **Real-Time File Protection** child node.

3. Click the **Properties** link in the results pane.

The **Task settings** window opens.

4. In the **Deep** section, select the **Block access to network shared resources for the sessions that show malicious activity** check box if you want Kaspersky Embedded Systems Security to block network sessions on which malicious activity is detected while the Real-Time File Protection task is running.

5. If the task has not been started, open the **Schedule** tab:

- a. Select the **Run by schedule** check box.

b. Select the **At application launch** frequency in the drop-down list.

6. In the **Task settings** window, click **OK**.

The newly configured settings are saved.

*Configure the Network Threat Protection task:*

1. In the Application Console tree, expand the **Real-Time Computer Protection** node.
2. Select the **Network Threat Protection** child node.
3. Click the **Properties** link in the details pane of the **Network Threat Protection** node.
4. The **Task settings** window opens.
5. Open the **General** tab.
6. In the **Processing mode** section select the **[Block connections when attack is detected](#)**  processing mode.

The check box enables or disables adding hosts showing activity typical of network attacks to the list of blocked hosts.

If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, logs events about detected activity, and adds IP addresses of hosts showing activity typical of network attacks to the list of blocked hosts.

The mode is selected by default.

You can view the list of blocked hosts in the [Blocked Hosts storage](#).

You can restore access to blocked hosts, and specify the number of days, hours and minutes after which hosts regain access to network file resources after being blocked by configuring the [Blocked Hosts storage settings](#).

7. Select or clear the **[Don't stop traffic analysis when the task is not running](#)**  check box.

If this check box is selected, when Network Threat Protection task is stopped, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks and blocks network activity from the attacking computer depending on the selected processing mode.

If this check box is cleared, when Network Threat Protection task is stopped, Kaspersky Embedded Systems Security doesn't scan inbound network traffic for activity that is typical of network attacks and doesn't block network activity from the attacking computer.

The check box is cleared by default.

8. If the task has not been started, open the **Schedule** tab:

a. Select the **Run by schedule** check box.

b. Select the **At application launch** frequency in the drop-down list.

9. In the **Task settings** window, click **OK**.

The newly configured settings are saved.

## Configuring settings for the List of blocked network sessions

*To configure the List of blocked network sessions:*

1. In the Application Console tree, expand the **Storages** node.
2. Open the context menu of the **Blocked network sessions** child node.
3. Select the **Properties** menu option.  
The **Settings for the List of blocked network sessions** window is displayed.
4. In the **Network session blocking term** section, specify the number of days, hours and minutes after which blocked network sessions regain access to network file resources after being blocked.
5. Click **OK**.
6. To restore access for all blocked network sessions:
  - a. Open the context menu of the **Blocked network sessions** child node.
  - b. Select the **Unblock all** option.  
All network sessions will be removed from the list and unblocked.
7. To remove several sessions from the list of blocked network sessions:
  - a. In the list of blocked network sessions, which is displayed in the results pane, select one or more sessions.
  - b. Open the context menu of the **Blocked network sessions** child node.
  - c. Select the **Unblock selected** option.  
The selected network sessions are unblocked.

## Managing the List of blocked network sessions via the Web Plug-in

In this section, learn how to configure the List of blocked network sessions settings via the Web Plug-in interface.

### Enabling network sessions blocking

To add network sessions showing any malicious or encrypting activity to the **Blocked network sessions** and block access to network file resources for those sessions, at least one of the following tasks must run in the active mode:

- Real-Time File Protection
- Network Threat Protection

*Configure the Real-Time File Protection task:*

1. In the main window of Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the <Policy name> window that opens select the **Application settings** tab.
4. Select the **Real-time computer protection** section.
5. Click **Settings** in the **Real-Time File Protection** subsection.
6. In the **Integration with other components** section, select the **Block access to network shared resources for the sessions that show malicious activity** check box if you want Kaspersky Embedded Systems Security to block current session and make network shared resources unavailable for network sessions for which malicious activity was detected.
7. If the task has not been started, open the **Task management** tab:
  - a. Select the **Run by schedule** check box.
  - b. Select the **At application launch** frequency in the drop-down list.
8. Click **Save**.

The newly configured settings are saved.

## Configuring settings for the List of blocked network sessions

*To configure the List of blocked network sessions:*

1. In the main window of Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the <Policy name> window that opens select the **Application settings** tab.
4. Select the **Supplementary** section.
5. Click **Settings** in the **Storages** subsection.
6. In the **Supplementary** section, click the **Settings** button in the **Storages** subsection.

The **Storages** window is displayed.
7. In the **Network session blocking term** section of the **Blocked network sessions** tab, specify the number of days, hours and minutes after which blocked network sessions regain access to network file resources after being blocked.
8. Click **OK**.

# Event registration. Kaspersky Embedded Systems Security logs

This section provides information about working with Kaspersky Embedded Systems Security logs.

## Ways to register Kaspersky Embedded Systems Security events

Events of Kaspersky Embedded Systems Security are divided into two groups:

- Events related to the processing of objects in Kaspersky Embedded Systems Security tasks.
- Events related to the administration of Kaspersky Embedded Systems Security, such as starting the application, creating or deleting tasks, or editing task settings.

Kaspersky Embedded Systems Security uses the following methods to log events:

- **Task logs.** A task log contains information about the current task status and events that occurred during task execution.
- **System audit log.** The system audit log contains information about events related to the administration of Kaspersky Embedded Systems Security.
- **Event Log.** The Event Log contains information about events required to diagnose failures in the operation of Kaspersky Embedded Systems Security. The Event Log is available in Microsoft Windows Event Viewer.
- **Security log.** The Security log contains information about events associated with security breaches or attempted security breaches on the protected device.

If a problem occurs during operation of Kaspersky Embedded Systems Security (for example, Kaspersky Embedded Systems Security or an individual task terminates abnormally or does not start), you can create a trace file and a dump file of Kaspersky Embedded Systems Security processes and send files with this information to Kaspersky Technical Support for analysis in order to diagnose the problem.

Kaspersky Embedded Systems Security does not send any trace or dump files automatically. Diagnostic data can only be sent by a user who has the required permissions.

Kaspersky Embedded Systems Security writes information to trace files and the dump file in unencrypted form. The folder where files are saved is selected by the user and managed by the operating system configuration and Kaspersky Embedded Systems Security settings. You can configure access permissions and allow only required users to access logs, trace files and dump files.

Files that can be downloaded by the following links contain tables with the full lists of Kaspersky Embedded Systems Security events of the following categories:

- Events that Kaspersky Embedded Systems Security writes to the Event Log.

[DOWNLOAD KESS-WEL-EVENTS.ZIP](#)

- Events that Kaspersky Embedded Systems Security sends to the Administration Server.

[DOWNLOAD KESS-KSC-EVENTS.ZIP](#)

## System audit log

Kaspersky Embedded Systems Security performs a system audit of events related to the administration of Kaspersky Embedded Systems Security. The application logs information about start of the application, starts and stops of Kaspersky Embedded Systems Security tasks, changes in task settings, and creation and deletion of On-Demand Scan tasks. Records of all those events are displayed in the results pane when you select the **System audit log** node in the Application Console.

By default, Kaspersky Embedded Systems Security stores records in the system audit log for an unlimited period of time. You specify the storage period for records in the system audit log.

You can specify a folder that Kaspersky Embedded Systems Security will use to store files containing system audit log other than the default one.

## Sorting events in the system audit log

By default, events in the system audit log node are displayed in reverse chronological order.

Events can be sorted by the contents of any column except the **Event** column.

*To sort events in the system audit log:*

1. In the Application Console tree, expand the **Logs and notifications** node.
2. Select the **System audit log** child node.
3. In the results pane, select the header of the column that you want to use to sort the events in the list.

The sorted results will be saved for the next time you view the system audit log.

## Filtering events in the system audit log

You can configure the system audit log to display only the records of events that meet the filtering conditions (filters) that you have specified.

*To filter events in the system audit log:*

1. In the Application Console tree, expand the **Logs and notifications** node.
2. Open the context menu of the **System audit log** child node and select **Filter**.  
The **Filter settings** window opens.
3. To add a filter, perform the following steps:
  - a. In the **Field name**, select a column to filter events.
  - b. In the **Operator** list, select the filtering condition. Filtering conditions vary depending on the item selected in the **Field name** list.

c. In the **Field value**, select a value for the filter.

d. Click the **Add** button.

The filter you added will appear in the list of filters in the **Filter settings** window.

4. If necessary, perform one of the following actions:

- To combine multiple filters using the logical operator "AND", select **If all conditions are met**.
- To combine multiple filters using the logical operator "OR", select **If any condition is met**.

5. Click the **Apply** button to save the filtering conditions in the system audit log.

The list of events of the system audit log displays only events that meet the filtering conditions. The filtered results will be saved for the next time you view the system audit log.

*To disable the filter:*

1. In the Application Console tree, expand the **Logs and notifications** node.

2. Open the context menu of the **System audit log** child node and select **Remove filter**.

The list of events of the system audit log will then display all events.

## Deleting events from the system audit log

By default, Kaspersky Embedded Systems Security stores records in the system audit log for an unlimited period of time. You can specify the storage period for records in the system audit log.

You can manually delete all events from the system audit log.

*To delete events from the system audit log:*

1. In the Application Console tree, expand the **Logs and notifications** node.

2. Open the context menu of the **System audit log** child node and select **Clear**.

3. Perform one of the following steps:

- If you want to save the log contents as a file in CSV or TXT format before deleting events from the system audit log, click the **Yes** button in the deletion confirmation window. In the window that opens, specify the name and location of the file.
- If you do not want to save the log contents as a file, click the **No** button in the deletion confirmation window.

The system audit log will be cleared.

## Task logs

This section provides information about Kaspersky Embedded Systems Security task logs and instructions on how to manage them.

## About task logs

Information about the execution of Kaspersky Embedded Systems Security tasks is displayed in the results pane when you select the **Task logs** node in the Application Console.

In the log of each task, you can view task execution statistics, details of each of the objects that have been processed by the application since the task started, and task settings.

By default, Kaspersky Embedded Systems Security stores records in task logs for 30 days after a task is done. You can change the storage period for records in task logs.

You can specify a folder that Kaspersky Embedded Systems Security will use to store files containing task logs other than the default one. You can also select events that Kaspersky Embedded Systems Security will record in task logs.

## Viewing the list of events in task logs

*To view task logs:*

1. In the Application Console tree, expand the **Logs and notifications** node.
2. Select the **Task logs** subnode.

The list of events saved in Kaspersky Embedded Systems Security task logs will be displayed in the results pane.

Events can be sorted by any column or filtered.

## Sorting task logs

By default, task logs are displayed in reverse chronological order. They can be sorted by any column.

*To sort task logs:*

1. In the Application Console tree, expand the **Logs and notifications** node.
2. Select the **Task logs** subnode.
3. In the results pane, select the header of the column that you want to use to sort Kaspersky Embedded Systems Security task logs.

The sorted results will be saved for the next time you view the task logs.

## Filtering task logs

You can configure the list of task logs to display only the task logs that meet the filtering conditions (filters) that you have specified.

*To filter task logs:*

1. In the Application Console tree, expand the **Logs and notifications** node.

2. Open the context menu of the **Task logs** child node and select **Filter**.

The **Filter settings** window opens.

3. To add a filter, perform the following steps:

a. In the **Field name**, select a column to filter task logs.

b. In the **Operator** list, select the filtering condition. Filtering conditions vary depending on the item selected in the **Field name** list.

c. In the **Field value**, select a value for the filter.

d. Click the **Add** button.

The filter you added will appear in the list of filters in the **Filter settings** window.

4. If necessary, perform one of the following actions:

- To combine multiple filters using the logical operator "AND", select **If all conditions are met**.
- To combine multiple filters using the logical operator "OR", select **If any condition is met**.

5. Click the **Apply** button to save the filtering conditions in the list of task logs.

The list of task logs displays only task logs that meet the filtering conditions. The filtered results will be saved for the next time you view the task logs.

*To disable the filter:*

1. In the Application Console tree, expand the **Logs and notifications** node.

2. Open the context menu of the **Task logs** child node and select **Remove filter**.

The list of task logs will then display all task logs.

## Viewing statistics and information about a Kaspersky Embedded Systems Security task in task logs

In task logs, you can view detailed information about all events that have occurred in tasks since they started, as well as task execution statistics and task settings.

*To view statistics and information about a Kaspersky Embedded Systems Security task:*

1. In the Application Console tree, expand the **Logs and notifications** node.

2. Select the **Task logs** subnode.

3. In the results pane, open the **Logs** window using one of the following methods:

- Double-click the task log you want to view.

- Open the context menu of the task log you want to view and select **View log**.

4. In the window that opens, the following details are displayed:

- The **Statistics** tab displays the time of task start and completion, as well as task statistics.
- The **Events** tab displays a list of events logged during task execution.
- The **Options** tab displays the task settings.

5. If necessary, click the **Filter** button to filter the events in the task log.

6. If necessary, click the **Export** button to export data from the task log into a file in CSV or TXT format.

7. Click the **Close** button.

The **Logs** window will be closed.

## Exporting information from a task log

You can export data from a task log into a file in CSV or TXT format.

*To export data from a task log:*

1. In the Application Console tree, expand the **Logs and notifications** node.
2. Select the **Task logs** subnode.
3. In the results pane, open the **Logs** window using one of the following methods:
  - Double-click the task log you want to view.
  - Open the context menu of the task log you want to view and select **View log**.
4. In the lower part of the **Logs** window, click the **Export** button.  
The **Save as** window opens.
5. Specify the name, location, type, and encoding of the file to which you want to export data from the task log.
6. Click the **Save** button.

The specified settings are saved.

## Deleting task logs

By default, Kaspersky Embedded Systems Security stores records in task logs for 30 days after a task is done. You can change the storage period for records in task logs.

You can manually delete task logs that are already complete.

Events from the logs of tasks that are currently running and tasks being used by other users will not be deleted.

*To delete the task logs:*

1. In the Application Console tree, expand the **Logs and notifications** node.
2. Select the **Task logs** subnode.
3. Perform one of the following steps:
  - If you want to delete the logs of all tasks that are already complete, open the context menu of the **Task logs** child node and select **Clear**.
  - If you want to clear the log of an individual task, in the results pane, open the context menu the task log you want to clear, and select **Remove**.
  - If you want to clear the logs of several tasks:
    - a. In the results pane, use the **Ctrl** or **Shift** key to select the task logs you want to clear.
    - b. Open the context menu of any selected task log and select **Remove**.
4. Click the **Yes** button in the deletion confirmation window to confirm that you want to delete the logs.

The task logs that you selected will be cleared. The deletion of task logs will be recorded in the system audit log.

## Security log

Kaspersky Embedded Systems Security maintains a log of events associated with security breaches or attempted security breaches on the protected device. The following events are recorded in this log:

- Exploit Prevention events.
- Critical Log Inspection events.
- Critical events that indicate an attempted security breach (for the Real-Time Computer Protection, On-Demand Scan, File Integrity Monitor, Applications Launch Control, and Device Control tasks).

You can clear the Security log. Moreover, Kaspersky Embedded Systems Security records a system audit event when the Security log is cleared.

## Viewing the event log of Kaspersky Embedded Systems Security in Event Viewer

You can view the event log of Kaspersky Embedded Systems Security using the Microsoft Windows Event Viewer snap-in for Microsoft Management Console. The log contains events registered by Kaspersky Embedded Systems Security and required to diagnose failures in its operation.

Events that will be registered in the event log can be selected based on the following criteria:

- **by event types.**
- **by level of detail.** The level of detail corresponds to the importance level of the events registered in the log (informational, important, or critical events). The most detailed is the Informational level, which registers all events. The least detailed is the Critical level, which registers only critical events.

To view the Kaspersky Embedded Systems Security event log:

1. Click the **Start** button, enter the `mmc` command at the search bar, and press **ENTER**.  
Microsoft Management Console opens.
2. Select **File > Add or remove snap-in**.  
The **Add or remove snap-ins** window opens.
3. In the list of available snap-ins, select the **Event Viewer snap-in** and click the **Add** button.  
The **Select computer** window opens.
4. In the **Select computer** window, specify the protected device on which Kaspersky Embedded Systems Security is installed, and click **OK**.
5. In the **Add and remove snap-ins** window, click **OK**.  
In the Microsoft Management Console tree, the **Event Viewer** node appears.
6. Expand the **Event Viewer** node and select the **Applications and Services Logs > Kaspersky Embedded Systems Security** child node.  
  
The Kaspersky Embedded Systems Security event log opens.

## Configuring log settings via the Application Console

You can edit the following settings of Kaspersky Embedded Systems Security logs:

- Length of the storage period for events in task logs and the system audit log.
- Location of the folder in which Kaspersky Embedded Systems Security stores task log files and the system audit log file.
- Events generation thresholds for *Application database is out of date*, *Application database is extremely out of date* and *Critical areas scan has not been performed for a long time*.
- Events that Kaspersky Embedded Systems Security saves in task logs, the system audit log, and the event log of Kaspersky Embedded Systems Security in Event Viewer.
- Settings for publishing audit events and task performance events to the syslog server via the Syslog protocol.

To configure Kaspersky Embedded Systems Security logs, perform the following steps:

1. In the Application Console tree, open the context menu of the **Logs and notifications** node and select **Properties**.  
The **Logs and notifications settings** window opens.
2. In the **Logs and notifications settings** window, configure the logs in accordance with your requirements. To do this, perform the following actions:

- On the **General** tab, if necessary, select events that Kaspersky Embedded Systems Security will save in task logs, the system audit log, and the event log of Kaspersky Embedded Systems Security in Event Viewer. To do this, perform the following actions:

- In the **Component** list, select the component of Kaspersky Embedded Systems Security for which you want to set the detail level.

For the Real-Time File Protection, On-Demand Scan, and Update components, events are recorded in task logs and the event log. For these components, the event table contains the **Task log** and **Windows Event Log** columns. Events for the Quarantine and Backup components are registered in the system audit log and the event log. For these components, the event table contains the **Audit** and **Windows Event Log** columns.

- In the **Importance level** list, select a detail level for events in task logs, the system audit log, and the event log for the selected component.

In the following table with a list of events, the check boxes are selected next to events that are registered in task logs, the system audit log, and the event log, according to the current detail level.

- If you want to manually enable registration of specific events for a selected component, perform the following actions:

a. In the **Importance level** list, select **Custom**.

b. In the table with the list of events, select the check boxes next to events that you want to be registered in task logs, the system audit log, and the event log.

- On the **Advanced** tab, configure the log storage settings and event generation thresholds for device protection status:

- In the **Log storage** section:

- [Logs folder](#) ?
- [Remove task logs older than \(days\)](#) ?
- [Remove from the system audit log events older than \(days\)](#) ?

- In the **Event generation thresholds** section:

- Specify the number of days after which the *Application database is out of date*, *Application database is extremely out of date* and *Critical areas scan has not been performed for a long time* events [will occur](#) ?.

- On the **SIEM integration** tab, configure the settings for publishing audit events and task performance events to the [syslog server](#).

3. Click **OK** to save the changes.

## About SIEM integration

To reduce the load on low-performance devices and to reduce the risk of system degradation as a result of increased application log sizes, you can configure the publication of audit events and task performance events to the *syslog server* via the Syslog protocol.

A syslog server is an external server for aggregating events (SIEM). It stores and analyzes received events and performs other log management actions.

You can use SIEM integration in two modes:

- Duplicate events on the syslog server: in this mode, all task performance events whose publication is configured in log settings, as well as all system audit events, continue to be stored on the protected device even after they are sent to the SIEM server.

We recommend that you use this mode to reduce the load on the protected device as much as possible.

- Delete local copies of events: in this mode, all events that are registered during application operation and published to the SIEM server will be deleted from the protected device.

The application never deletes local versions of the security log.

Kaspersky Embedded Systems Security can convert events in application logs into formats supported by the syslog server so that those events can be transmitted and successfully recognized by the SIEM server. The application supports conversion into structured data format and into JSON format.

We recommend that you select the format of events based on the configuration of the utilized SIEM server.

## Reliability settings

You can reduce the risk that events will be relayed to the SIEM server unsuccessfully by defining the settings for connecting to a mirror syslog server.

A mirror syslog server is an additional syslog server to which the application switches automatically if the connection to the main syslog server is unavailable or if the main server cannot be used.

Kaspersky Embedded Systems Security also uses system audit events to notify you about unsuccessful attempts to connect to the SIEM server and about errors while sending events to the SIEM server.

## Configuring SIEM integration settings

By default, SIEM integration is not used. You can enable and disable SIEM integration, and configure relevant settings (see the table below).

SIEM integration settings

Setting	Default value	Description
<b>Send events to a remote syslog server via syslog protocol</b>	Not applied	You can enable or disable SIEM integration by selecting or clearing the check box, respectively.
<b>Remove local copies for events that have been sent to a remote syslog server</b>	Not applied	You can configure the settings for storing local copies of logs after they are sent to the SIEM server by selecting or clearing the check box.
<b>Events format</b>	Structured	You can select one of two formats to which the application

	data	converts its events prior to sending them to the syslog server for better recognition of these events by the SIEM server.
<b>Connection protocol</b>	TCP	You can use the drop-down list to configure the connection to the main and mirror syslog servers via the UDP or TCP protocols.
<b>Main syslog server connection settings</b>	IP address: 127.0.0.1 Port: 514	You can use the appropriate fields to configure the IP address and port used to connect to the main syslog server. You can specify the IP address only in IPv4 format.
<b>Use mirror syslog server if the main server is not accessible</b>	Not applied	You can use the check box to enable or disable the use of a mirror syslog server.
<b>Mirror syslog server connection settings</b>	IP address: 127.0.0.1 Port: 514	You can use the appropriate fields to configure the IP address and port used to connect to the mirror syslog server. You can specify the IP address only in IPv4 format.

To configure SIEM integration settings:

1. In the Application Console tree, open the context menu of the **Logs and notifications** node.
2. Select **Properties**.  
The **Logs and notifications settings** window opens.
3. Select the **SIEM integration** tab.
4. In the **Integration settings** section, select the [Send events to a remote syslog server via syslog protocol](#) check box.
5. If necessary, in the **Integration settings** section, select the [Remove local copies for events that have been sent to a remote syslog server](#) check box.

The status of the **Remove local copies for events that have been sent to a remote syslog server** check box does not affect the settings for storing events of the security log: the application never automatically deletes security log events.

6. In the **Events format** section, specify the format to which you want to convert application events so that they can be sent to the SIEM server.  
By default, the application converts them into a structured data format.
7. In the **Connection settings** section:
  - Specify the SIEM connection protocol.
  - Specify the settings for connecting to the main syslog server.  
You can only specify an IP address in IPv4 format.
  - Select the **Use mirror syslog server if the main server is not accessible** check box if you want the application to use other connection settings when unable to send events to the main syslog server.  
Specify the following settings for connecting to the mirror syslog server: **Address** and **Port**.  
The **Address** and **Port** fields for the mirror syslog server cannot be edited if the **Use mirror syslog server if the main server is not accessible** check box is cleared.  
You can only specify an IP address in IPv4 format.

8. Click **OK**.

The configured SIEM integration settings will be applied.

## Configuring logs and notifications settings via the Administration Plug-in

The Kaspersky Security Center Administration Console can be used to configure notifications for administrator and users about the following events in the operation of Kaspersky Embedded Systems Security and the anti-virus protection status on the device:

- The administrator can receive information about events of selected types.
- LAN users who access the protected device and terminal protected device users can receive information about *Object detected* events.

Notifications about Kaspersky Embedded Systems Security events can be configured either for a single protected device using the **Properties: <Protected device name>** window of the selected protected device, or for a group of protected devices in the **Properties: <Policy name>** window of the selected administration group.

On the **Event notifications** tab or in the **Notification settings** window, you can configure the following types of notifications:

- Administrator notifications about events of selected types can be configured using the **Event notifications** tab (the standard tab in Kaspersky Security Center). For details on notification methods, see the *Kaspersky Security Center Help*.
- Both administrator and user notifications can be configured in the **Notification settings** window.

You can configure notifications for some event types only in the window or on the tab; you can use both the window and tab to configure notifications for other event types.

If you configure notifications about events of the same type using the same mode on the **Event notifications** tab and in the **Notification settings** window, the system administrator will receive notifications for those events twice but in the same mode.

## Configuring task logs settings

To configure Kaspersky Embedded Systems Security logs, perform the following steps:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Logs and notifications** section, click the **Settings** button in the **Task logs** subsection.
5. In the **Logs settings** window define the following settings of Kaspersky Embedded Systems Security according to your requirements:
  - Configure the level of detail of events in logs. To do this, perform the following actions:
    - a. In the **Component** list select the component of Kaspersky Embedded Systems Security for which you want to set the detail level.
    - b. To define the level of detail in the task logs and system audit log for the selected component, choose the level you need from **Importance level**.
  - To change the default location for logs, specify the full path to the folder or click the **Browse** button to select it.
  - Specify how many days task logs will be stored.
  - Specify how many days information displayed in the **System audit log** node will be stored.
6. Click **OK**.

The configured log settings are saved.

## Security log

Kaspersky Embedded Systems Security maintains a log of events associated with security breaches or attempted security breaches on the protected device. The following events are recorded in this log:

- Exploit Prevention events.
- Critical Log Inspection events.
- Critical events that indicate an attempted security breach (for the Real-Time Computer Protection, On-Demand Scan, File Integrity Monitor, Applications Launch Control, and Device Control tasks).

You can clear the Security log. Moreover, Kaspersky Embedded Systems Security records a system audit event when the Security log is cleared.

## Configuring SIEM integration settings

To reduce the load on low-performance devices and to reduce the risk of system degradation as a result of increased application log sizes, you can configure the publication of audit events and task performance events to the *syslog server* via the Syslog protocol.

A syslog server is an external server for aggregating events (SIEM). It stores and analyzes received events and performs other log management actions.

You can use SIEM integration in two modes:

- Duplicate events on the syslog server: in this mode, all task performance events whose publication is configured in log settings, as well as all system audit events, continue to be stored on the protected device even after they are sent to the SIEM server.

We recommend that you use this mode to reduce the load on the protected device as much as possible.

- Delete local copies of events: in this mode, all events that are registered during application operation and published to the SIEM server will be deleted from the protected device.

The application never deletes local versions of the security log.

Kaspersky Embedded Systems Security can convert events in application logs into formats supported by the syslog server so that those events can be transmitted and successfully recognized by the SIEM server. The application supports conversion into structured data format and into JSON format.

To reduce the risk that events will be relayed to the SIEM server unsuccessfully, you can define settings for connecting to a mirror syslog server.

A mirror syslog server is an additional syslog server to which the application switches automatically if the connection to the main syslog server is unavailable or if the main server cannot be used.

By default, SIEM integration is not used. You can enable and disable SIEM integration, and configure relevant settings (see the table below).

SIEM integration settings

Setting	Default value	Description
<b>Send events to a remote syslog server via syslog protocol</b>	Not applied	You can enable or disable SIEM integration by selecting or clearing the check box, respectively.
<b>Remove local copies for events that have been sent to a remote syslog server</b>	Not applied	You can configure the settings for storing local copies of logs after they are sent to the SIEM server by selecting or clearing the check box.
Events format	Structured data	You can select one of two formats to which the application converts its events prior to sending them to the syslog server for better recognition of these events by the SIEM server.
Connection protocol	TCP	You can use the drop-down list to configure the connection to the main syslog server via the UDP or TCP protocols; to the mirror syslog server via the TCP protocol.
Main syslog server connection settings	IP address: 127.0.0.1 Port: 514	You can use the appropriate fields to configure the IP address and port used to connect to the main syslog server. You can specify the IP address only in IPv4 format.
<b>Use mirror syslog server if the main server is not accessible</b>	Not applied	You can use the check box to enable or disable the use of a mirror syslog server.
Mirror syslog server connection settings	IP address: 127.0.0.1 Port: 514	You can use the appropriate fields to configure the IP address and port used to connect to the mirror syslog server. You can specify the IP address only in IPv4 format.

To configure SIEM integration settings:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.

2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Logs and notifications** section click the **Settings** button in the **Task logs** subsection.  
The **Logs and notifications settings** window opens.
5. Select the **SIEM integration** tab.
6. In the **Integration settings** section, select the [Send events to a remote syslog server via syslog protocol](#) check box.
7. If necessary, in the **Integration settings** section, select the [Remove local copies for events that have been sent to a remote syslog server](#) check box.

The status of the **Remove local copies for events that have been sent to a remote syslog server** check box does not affect the settings for storing events of the security log: the application never automatically deletes security log events.

8. In the **Events format** section, specify the format to which you want to convert application events so that they can be sent to the SIEM server.  
By default, the application converts them into a structured data format.
9. In the **Connection settings** section:
  - Specify the SIEM connection protocol.
  - Specify the settings for connecting to the main syslog server.  
You can only specify an IP address in IPv4 format.
  - Select the **Use mirror syslog server if the main server is not accessible** check box if you want the application to use other connection settings when unable to send events to the main syslog server.  
Specify the following settings for connecting to the mirror syslog server: **Address** and **Port**.  
The **Address** and **Port** fields for the mirror syslog server cannot be edited if the **Use mirror syslog server if the main server is not accessible** check box is cleared.  
You can only specify an IP address in IPv4 format.

10. Click **OK**.

The configured SIEM integration settings will be applied.

## Configuring notification settings

To configure Kaspersky Embedded Systems Security notifications, perform the following steps:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Logs and notifications** section, click the **Settings** button in the **Event notifications** subsection.
5. In the **Notification settings** window, define the following settings of Kaspersky Embedded Systems Security according to your requirements:
  - In the **Notification settings** list select the type of notification whose settings you want to configure.
  - In the **Notify users** section configure the user notification method. If necessary, enter the text of the notification message.
  - In the **Notify administrators** section configure the administrator notification method. If necessary, enter the text of the notification message. If necessary, configure additional notification settings by clicking the **Settings** button.
  - In the **Event generation thresholds** section, specify the time intervals after which Kaspersky Embedded Systems Security logs *Application database is out of date*, *Application database is extremely out of date* and *Critical areas scan has not been performed for a long time* events.
    - [Application database is out of date \(days\)](#) 
    - [Application database is extremely out of date \(days\)](#) 
    - [Critical areas scan has not been performed for a long time \(days\)](#) 
6. Click **OK**.

The configured notification settings are saved.

## Configuring interaction with the Administration Server

To select the types of objects about which Kaspersky Embedded Systems Security sends information to the Kaspersky Security Center Administration Server:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Logs and notifications** section, click the **Settings** button in the **Interaction with Administration Server** subsection.

The **Administration Server Network lists** window opens.

5. In the **Administration Server Network lists** window, select the types of objects about which Kaspersky Embedded Systems Security will send information to the Kaspersky Security Center Administration Server:

- Quarantined objects.
- Backed up objects.

6. Click **OK**.

Kaspersky Embedded Systems Security will send information about the selected object types to the Administration Server.

# Notification settings

This section provides information about ways in which users and administrators of Kaspersky Embedded Systems Security can be notified about application events and the device protection status, as well as instructions on how to configure notifications.

## Administrator and user notification methods

You can configure the application to notify the administrator and users who access the device about the following events in the operation of Kaspersky Embedded Systems Security and the anti-virus protection status on the device.

- The administrator can receive information about events of selected types.
- LAN users who access a device and terminal device users can receive information about events of the *Object detected* type in the Real-Time File Protection task.

In the Application Console, administrator or user notifications can be activated using several methods:

- User notification methods:
  - a. Terminal service tools.  
You can apply this method for notifying terminal protected device users if the protected device is used as terminal.
  - b. Message service tools.  
You can apply this method for notification via Microsoft Windows message services.
- Administrator notification methods:
  - a. Message service tools.  
You can apply this method for notification via Microsoft Windows message services.
  - b. Running an executable file.  
This method runs an executable file stored on the protected device's local drive when an event occurs.
  - c. Sending by email.  
This method uses email to transmit messages.

You can create the text of a message for individual event types. It can include an information field to describe an event. By default, the application uses a default message to notify users.

## Configuring administrator and user notifications

Event notification settings give you a choice of methods for configuring and composing a message text.

*To configure event notification settings:*

1. In the Application Console tree, open the context menu of the **Logs and notifications** node and select **Properties**.

The **Logs and notifications settings** window opens.

2. On the **Notifications** tab select the notification mode:

- a. Select the event for which you wish to select a notification method from the **Event type** list.
- b. In the **Notify administrators** or **Notify users** group settings, select the check box next to the notification methods that you wish to configure.

You can only configure user notifications for the following events: **Object detected**, **Untrusted external device detected and restricted** event, and **Network session listed as untrusted** event.

3. To add the text of a message:

- a. Click the **Message text** button.
- b. In the window that opens, enter the text to be displayed in the corresponding event message.

You can create the same message for several event types: after selecting a notification method for one event type, use the **Ctrl** or **Shift** key to select the other event types for which you want to use the same message, and then click the **Message text** button.

a. To add fields with information about an event, click the **Macro** button and select the relevant fields from the drop-down list. Fields with event information are described in the table in this section.

b. To restore the default event message text, click the **By default** button.

4. To configure administrator notification methods for the selected event, select the **Notifications** tab, click the **Settings** button in the **Notify administrators** section and configure the selected methods in the **Advanced settings** window. To do this, perform the following actions:

- a. For email notifications, open the **Email** tab and specify the email addresses of recipients (delimit addresses with semicolon), name or network address of the SMTP server, and port number in the appropriate fields. If necessary, specify the text that will be displayed in the **Subject** and **From** fields. The text in the **Subject** field can also include variables with information about the event (see table below).

If you want to apply user account authentication when connecting to the SMTP server, select **Use SMTP authentication** in the **Authentication settings** group and specify the name and password of the user whose user account will be authenticated.

- b. For notifications using Windows Messenger Service, create a list of recipient protected devices for notifications on the **Windows Messenger Service** tab: for each protected device that you wish to add, click the **Add** button and enter its network name in the input field.
- c. To run an executable file, select the file on the protected device's local drive that will be executed on the protected device when an event occurs or enter its full path on the **Executable file** tab. Enter the user name and password which will be used to execute the file.

System environment variables can be used when the path to the executable file is specified; user environment variables are not allowed.

If you wish to limit the number of messages of one event type over a period of time, on the **Advanced** tab, select **Do not send the same notification more than** and specify the number of times and a time interval.

5. Click **OK**.

The configured notification settings are saved.

Fields with event information

Variable	Description
%EVENT_TYPE%	Event type.
%EVENT_TIME%	Event time.
%EVENT_SEVERITY%	Importance level.
%OBJECT%	Object name (in Real-Time Computer Protection and On-Demand Scan tasks). The Software Modules Update task includes the name of the update and the address of the web page with information on the update.
%VIRUS_NAME%	The name of the object according to the <a href="#">Virus Encyclopedia classification</a> . This name is included in the full name of the detected object that Kaspersky Embedded Systems Security returns on detecting an object. You can view the full name of the detected object in the <a href="#">task log</a> .
%VIRUS_TYPE%	The type of detected object according to the Kaspersky classification, such as "virus" or "trojan". It is included in the full name of the detected object, which is returned by Kaspersky Embedded Systems Security when it finds an object infected or probably infected. You can view the full name of the detected object in the task log.
%USER_COMPUTER%	In the Real-time File Protection task the protected device name for the user who accessed the object on the device.
%USER_NAME%	In the Real-Time File Protection task the name of the user who accessed the object on the device.
%FROM_COMPUTER%	Name of the protected device where the notification originated.
%EVENT_REASON%	Reason the event occurred (some events do not have this field).
%ERROR_CODE%	Error code (only for the "internal task error" event).
%TASK_NAME%	Task name (only for events related to task performance).

# Starting and stopping Kaspersky Embedded Systems Security

This section contains information about starting Application Console and about starting and stopping the Kaspersky Security Service.

## Starting the Kaspersky Embedded Systems Security Administration Plug-in

No additional actions are required to start the Kaspersky Embedded Systems Security Administration Plug-in in Kaspersky Security Center. Once the Plug-in is installed on the administrator's protected device, it is started together with Kaspersky Security Center. Detailed information about starting Kaspersky Security Center can be found in the *Kaspersky Security Center Help*.

## Starting the Kaspersky Embedded Systems Security Console from the Start menu

The names of settings may vary under different Windows operating systems.

*To start the Application Console from the **Start** menu:*

1. In the **Start** menu, select **Programs > Kaspersky Embedded Systems Security > Administration Tools > Kaspersky Embedded Systems Security Console**.

To add other snap-ins to the Application Console, start the Application Console in author mode.

*To start the Application Console in author mode:*

1. In the **Start** menu, select **Programs > Kaspersky Embedded Systems Security > Administration Tools**.
2. In the context menu of the Application Console, select the **Author** command.

The Application Console is started in author mode.

If the Application Console has been started on the protected device, the Application Console window opens.

If you started the Application Console on a non-protected device, connect to the protected device.

*To connect to the protected device:*

1. In the Application Console tree, open the context menu of the **Kaspersky Embedded Systems Security** node.
2. Select the **Connect to another computer** command.  
The **Select protected device** window opens.
3. Select **Another device** in the window that opens.
4. Specify the network name of the protected device in the entry field on the right.
5. Click **OK**.

The Application Console will connect to the protected device.

If the user account that you are using to log in to Microsoft Windows does not have sufficient permissions to access the Kaspersky Security Management Service on the protected device, select the **Connect as user** check box and specify a different user account that the required permissions.

## Starting and stopping the Kaspersky Security Service

By default, the Kaspersky Security Service starts automatically immediately after the operating system. The Kaspersky Security Service manages the work processes that execute the Real-Time Computer Protection, Computer Control, On-Demand Scan and update tasks.

By default when Kaspersky Embedded Systems Security is started, the Real-Time File Protection and Scan at Operating System Startup tasks are started, as well as other tasks that are scheduled to start **At application launch**.

If the Kaspersky Security Service is stopped, all running tasks are stopped. After you restart the Kaspersky Security Service, the application automatically starts only those tasks scheduled to run **At application launch**, while other tasks have to be started manually.

You can start and stop the Kaspersky Security Service using the context menu of the **Kaspersky Embedded Systems Security** node or using the Microsoft Windows Services snap-in.

You can start and stop Kaspersky Embedded Systems Security if you are a member of the Administrators group on the protected device.

*To stop or start the application using the Application Console:*

1. In the Application Console tree, open the context menu of the **Kaspersky Embedded Systems Security** node.
2. Select one of the following items:
  - **Stop the service.**
  - **Start the service.**

The Kaspersky Security Service will be started or stopped.

## Starting Kaspersky Embedded Systems Security components in the operating system safe mode

This section provides information about Kaspersky Embedded Systems Security working in the operating system safe mode.

## About Kaspersky Embedded Systems Security working in the operating system safe mode

Kaspersky Embedded Systems Security components can be started when the operating system loads in safe mode. In addition to the Kaspersky Security Service (kavfs.exe), the klam.sys driver is loaded. It is used to register the Kaspersky Security Service as a protected service during the start of the operating system. For more details, see section [Registering the Kaspersky Security Service as a protected service](#).

Kaspersky Embedded Systems Security can be started in the following safe modes of the operating system:

- Safe Mode Minimal – This mode is started when the standard option of the operating system safe mode is selected. At that, Kaspersky Embedded Systems Security can start the following components:
  - Real-Time File Protection.
  - On-Demand Scan.
  - Applications Launch Control and Rule Generator for Applications Launch Control.
  - Log Inspection.
  - File Integrity Monitor.
  - Baseline File Integrity Monitor.
  - Application Integrity Control.

Safe Mode with Networking – In this mode, the operating system is loaded in safe mode with network drivers. In addition to the components started in Safe Mode Minimal, Kaspersky Embedded Systems Security can start the following components in this mode:

- Database Update.
- Software Modules Update.

## Starting Kaspersky Embedded Systems Security in safe mode

By default, Kaspersky Embedded Systems Security is not started when the operating system is loaded in safe mode.

*To make Kaspersky Embedded Systems Security start in the operating system safe mode:*

1. Start Windows Registry Editor (C:\Windows\regedit.exe).
2. Open the [HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\klam\Parameters] key of the system registry.
3. Open the LoadInSafeMode parameter.
4. Set the value to 1.
5. Click **OK**.

*To cancel start of Kaspersky Embedded Systems Security in the operating system safe mode:*

1. Start Windows Registry Editor (C:\Windows\regedit.exe).

2. Open the [HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\klam\Parameters] key of the system registry.
3. Open the LoadInSafeMode parameter.
4. Set the value to 0.
5. Click **OK**.

# Kaspersky Embedded Systems Security self-defense

This section provides information about Kaspersky Embedded Systems Security self-defense mechanisms.

## About Kaspersky Embedded Systems Security self-defense

Kaspersky Embedded Systems Security has self-defense mechanisms that protect the application against modification or deletion of its folders, memory processes, and system registry entries.

## Protection from changes to folders with installed Kaspersky Embedded Systems Security components

Kaspersky Embedded Systems Security blocks renaming and deletion of folders with the installed application components by any user account. By default, the paths to the application installation folders are as follows:

- On the 32-bit version of Microsoft Windows: %ProgramFiles%\Kaspersky Lab\Kaspersky Embedded Systems Security\
- On the 64-bit version of Microsoft Windows: %ProgramFiles(x86)%\Kaspersky Lab\Kaspersky Embedded Systems Security\

## Protection from changes to Kaspersky Embedded Systems Security registry keys

Kaspersky Embedded Systems Security restricts access to the following registry branches and keys, which facilitates loading of application drivers and services:

- [HKEY\_LOCAL\_MACHINE\SOFTWARE\Wow6432Node\KasperskyLab\ESS]
- [HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\kavfs]
- [HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\kavfsgt]
- [HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\kavfsslpl]
- [HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\klam]
- [HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\klelam]
- [HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\klfltdev]
- [HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\klramdisk]
- [HKEY\_LOCAL\_MACHINE\SOFTWARE\KasperskyLab\ESS\3.2\CrashDump]
- [HKEY\_LOCAL\_MACHINE\SOFTWARE\Wow6432Node\KasperskyLab\ESS\3.2] (on the 64-bit version of Microsoft Windows)

- [HKEY\_LOCAL\_MACHINE\SOFTWARE\KasperskyLab\ESS\3.2\Trace]

The rights to change these registry branches and keys are granted to Local System (SYSTEM) account only. User and Administrator accounts are granted read-only rights.

## Protection from changes to the memory of program service parts

To protect program service parts from third-party processes, Kaspersky Embedded Systems Security drivers restrict access to the following executable files:

- kavfs.exe
- kavfswp.exe
- kavfswh.exe
- kavfsgt.exe

By default, access to the memory of Kaspersky Embedded Systems Security service parts is restricted for third-party processes.

You can enable the self-defense functions in the [Kaspersky Embedded Systems Security Console](#) and [Kaspersky Embedded Systems Security Administration Plug-in](#) policy properties.

## Registering the Kaspersky Security Service as a protected service

*Protected Process Light* (also referred to as "PPL") technology ensures that the operating system only loads trusted services and processes. For a service to run as a protected service, an *Early Launch Antimalware* driver must be installed on the protected device.

An *Early Launch Antimalware* (also referred to as "ELAM") driver provides protection for the devices in your network when they start and before third-party drivers are initialized.

The ELAM driver is automatically installed during the Kaspersky Embedded Systems Security installation and is used for registering the Kaspersky Security Service as PPL when the operating system starts. When the Kaspersky Security Service (KAVFS) is started as a system protected process, other non-protected processes on the system are not able to inject threads, write into the virtual memory of the protected process, or stop the service.

When a process is started as PPL, it cannot be managed by user disregarding the assigned user permissions. The Kaspersky Security Service registration as PPL using the ELAM driver is supported on the Microsoft Windows 10 and higher operating systems. If you install Kaspersky Embedded Systems Security on a server running PPL-supporting operating system, the permission management for Kaspersky Security Service (KAVFS) will not be available.

To install Kaspersky Embedded Systems Security as PPL, run the following command:

```
msiexec /i ess_x64.msi NOPPL=0 EULA=1 PRIVACYPOLICY=1 /qn
```

# Managing access permissions for Kaspersky Embedded Systems Security functions

This section contains information about permissions to manage Kaspersky Embedded Systems Security and operating system services registered by the application, and instructions on how to configure these permissions.

## About permissions to manage Kaspersky Embedded Systems Security

By default, access to all Kaspersky Embedded Systems Security functions is granted to users of the Administrators group on the protected device, users of the ESS Administrators group created on the protected device during installation of Kaspersky Embedded Systems Security, and the SYSTEM group.

Users who have Edit permissions access level for Kaspersky Embedded Systems Security can grant access to Kaspersky Embedded Systems Security functions to other users registered on the protected device or included in the domain.

Users who are not registered in the list of Kaspersky Embedded Systems Security users cannot open the Application Console.

You can choose one of the following preset access levels for a user or group of users:

- **Full control** – access to all application functions: the ability to view and edit Kaspersky Embedded Systems Security general settings, component settings, and Kaspersky Embedded Systems Security user permissions; and the ability to view Kaspersky Embedded Systems Security statistics.
- **Modification** – access to all application functions except editing of user permissions: the ability to view and edit Kaspersky Embedded Systems Security general settings and Kaspersky Embedded Systems Security component settings.
- **Read** – the ability to view Kaspersky Embedded Systems Security general settings, Kaspersky Embedded Systems Security component settings, Kaspersky Embedded Systems Security statistics, and Kaspersky Embedded Systems Security user permissions.

You can also configure advanced access permissions: allow or block access to specific functions of Kaspersky Embedded Systems Security.

If you have manually configured access permissions for a user or group, then the **Special permissions** access level is set for this user or group.

About access permissions for Kaspersky Embedded Systems Security functions

User rights	Description
Task management	Ability to start / stop / pause / resume Kaspersky Embedded Systems Security tasks.
Create and delete On-Demand Scan tasks	Ability to create and delete On-Demand Scan tasks.
Edit settings	Ability to: <ul style="list-style-type: none"><li>• Import Kaspersky Embedded Systems Security settings from a configuration file.</li></ul>

	<ul style="list-style-type: none"> <li>• Edit the application settings.</li> </ul>
Read settings	<p>Ability to:</p> <ul style="list-style-type: none"> <li>• View Kaspersky Embedded Systems Security general settings and task settings.</li> <li>• Export Kaspersky Embedded Systems Security settings to a configuration file.</li> <li>• View settings for task logs, system audit log, and notifications.</li> </ul>
Manage repositories	<p>Ability to:</p> <ul style="list-style-type: none"> <li>• Move objects to Quarantine.</li> <li>• Remove objects from Quarantine and Backup.</li> <li>• Restore objects from Quarantine and Backup.</li> </ul>
Manage logs	Ability to delete task logs and clear the system audit log.
Read logs	Ability to view Anti-Virus events in task logs and the system audit log.
Read statistics	Ability to view statistics for each Kaspersky Embedded Systems Security task.
Application licensing	Ability to activate Kaspersky Embedded Systems Security.
Uninstalling the application	Ability to uninstall Kaspersky Embedded Systems Security.
Read permissions	Ability to view the list of Kaspersky Embedded Systems Security users and user access privileges.
Edit permissions	<p>Ability to:</p> <ul style="list-style-type: none"> <li>• Edit the list of users with access to application management.</li> <li>• Edit user access permissions for Kaspersky Embedded Systems Security functions.</li> </ul>

## About permissions to manage registered services

During installation, Kaspersky Embedded Systems Security registers in Windows the Kaspersky Security Service (KAVFS), the Kaspersky Security Management Service (KAVFSGT) and Kaspersky Security Exploit Prevention (KAVFSSLP).

The Kaspersky Security Service can be registered as a Protected Process Light using the ELAM driver on Microsoft Windows 10 and higher operating systems. When a process is started as a PPL, it cannot be managed by a user regardless of the assigned user permissions. If you install Kaspersky Embedded Systems Security on a protected device running an operating system that supports PPL, permission management will not be available for the Kaspersky Security Service (KAVFS).

## Kaspersky Security Service

By default, access permissions for managing the Kaspersky Security Service are granted to users in the Administrators group on the protected device, as well as to the SERVICE and INTERACTIVE groups with read permissions and to the SYSTEM group with read and execute permissions.

Users who have the [Edit permissions level access](#) can grant access permissions for managing Kaspersky Security Service to other users registered on the protected device or included in the domain.

## Kaspersky Security Management Service

To manage the application via the Application Console installed on a different protected device, the account whose permissions are used to connect to Kaspersky Embedded Systems Security must have full access to the Kaspersky Security Management Service on the protected device.

By default, access to the Kaspersky Security Management Service is granted to users of the Administrators group on the protected device and users of the ESS Administrators group created on the protected device during Kaspersky Embedded Systems Security installation.

You can only manage the Kaspersky Security Management Service via the Microsoft Windows Services snap-in.

## Kaspersky Security Exploit Prevention

By default, access permissions for managing the Kaspersky Security Exploit Prevention service are granted to users in the Administrators group on the protected device, as well as to the SYSTEM group with read and execute permissions.

## About access permissions for the Kaspersky Security Management Service

You can review the list of Kaspersky Embedded Systems Security services.

During installation, Kaspersky Embedded Systems Security registers the Kaspersky Security Management Service (KAVFSGT). To manage the application via the Application Console installed on a different protected device, the account used to connect to Kaspersky Embedded Systems Security must have full access to the Kaspersky Security Management Service on the protected device.

By default, access to the Kaspersky Security Management Service is granted to users of the Administrators group on the protected device and users of the ESS Administrators group created on the protected device during installation of Kaspersky Embedded Systems Security.

You can manage the Kaspersky Security Management Service only via the Microsoft Windows Services snap-in.

You cannot allow or block user access to the Kaspersky Security Management Service by configuring Kaspersky Embedded Systems Security.

You can connect to Kaspersky Embedded Systems Security from a local account if an account with the same user name and password is registered on the protected device.

## About permissions to manage the Kaspersky Security Service

During installation, Kaspersky Embedded Systems Security registers the Kaspersky Security Service (KAVFS) in Windows, and internally enables the functional components that are started at operating system startup. To reduce the risk of third-party access to application functions and security settings on a protected device through management of the Kaspersky Security Service, you can restrict permissions for managing the Kaspersky Security Service from the Application Console or the Administration Plug-in.

By default, access permissions for managing the Kaspersky Security Service are granted to users in the Administrators group on the protected device. Read permissions are granted to the SERVICE and INTERACTIVE groups, and read and execute permissions are granted to the SYSTEM group.

You cannot delete the SYSTEM user account or edit permissions for this account. If the permissions for the SYSTEM account are edited, the maximum privileges are restored for this account when you save the changes.

Users who have [access to functions](#) that require Edit permissions can grant access permissions for managing the Kaspersky Security Service to other users registered on the protected device or included in the domain.

You can choose one of the following preset permission levels for a user or group of users of Kaspersky Embedded Systems Security to manage the Kaspersky Security Service:

- **Full control:** ability to view and edit general settings and user permissions for the Kaspersky Security Service, and to start and stop the Kaspersky Security Service.
- **Read:** ability to view Kaspersky Security Service general settings and user permissions.
- **Modification:** ability to view and edit Kaspersky Security Service general settings and user permissions.
- **Execution:** ability to start and stop the Kaspersky Security Service.

You can also configure advanced access permissions: allow or deny access to specific Kaspersky Embedded Systems Security functions (see the table below).

If you have manually configured access permissions for a user or group, then the **Special permissions** access level is set for this user or group.

Access permissions for Kaspersky Security Service functions

Feature	Description
View service configurations	Ability to view Kaspersky Security Service general settings and user permissions.
Request service status from Service Control Manager	Ability to request the execution status of the Kaspersky Security Service from Microsoft Windows Service Control Manager.
Request status from service	Ability to request the service execution status from the Kaspersky Security Service.
Read list of dependent services	Ability to view a list of services that the Kaspersky Security Service depends on and which depend on the Kaspersky Security Service.
Editing service settings	Ability to view and edit Kaspersky Security Service general settings and user permissions.

Start the service	Ability to start the Kaspersky Security Service.
Stop the service	Ability to stop the Kaspersky Security Service.
Pause / Resume the service	Ability to pause and resume the Kaspersky Security Service.
Read permissions	Ability to view the list of Kaspersky Security Service users and each user's access privileges.
Edit permissions	Ability to: <ul style="list-style-type: none"> <li>• Add and remove Kaspersky Security Service users.</li> <li>• Edit user access permissions for the Kaspersky Security Service.</li> </ul>
Delete the service	Ability to unregister the Kaspersky Security Service in the Microsoft Windows Service Control Manager.
User defined requests to service	Ability to create and send user requests to the Kaspersky Security Service.

## Managing access permissions via the Administration Plug-in

In this section, learn how to navigate the Administration Plug-In interface and configure access permissions for one or all protected devices on the network.

## Configuring access permissions for Kaspersky Embedded Systems Security and the Kaspersky Security Service

You can edit the list of users and user groups allowed to access Kaspersky Embedded Systems Security functions and manage the Kaspersky Security Service. You can also edit the access permissions of those users and user groups.

*To add or remove a user or group from the list:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Supplementary** section, perform one of the following steps:

- Click **Settings** in the **User access permissions for application management** subsection if you want to edit the list of users who have access permissions for managing Kaspersky Embedded Systems Security functions.
- Click **Settings** in the **User access permissions for Kaspersky Security Service management** subsection if you want to edit the list of users who have access permissions for managing the Kaspersky Security Service.

The **Permissions for Kaspersky Embedded Systems Security 3.2** group window opens.

5. In the window that opens, perform the following operations:

- In order to add a user or group to the list, click the **Add** button and select the user or group that you want to grant privileges to.
- To remove a user or group from the list, select the user or group whose access you want to restrict, and click the **Remove** button.

6. Click the **Apply** button.

The selected users (groups) are added or removed.

*To edit the permissions of a user or group to manage Kaspersky Embedded Systems Security or the Kaspersky Security Service:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.

2. Select the administration group for which you want to configure application settings.

3. Perform one of the following actions in the details pane of the selected administration group:

- To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
- To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Supplementary** section, perform one of the following steps:

- Click **Settings** in the **User access permissions for application management** subsection if you want to edit the list of users who have access permissions for managing Kaspersky Embedded Systems Security functions.
- Click **Settings** in the **User access permissions for Kaspersky Security Service management** subsection if you want to edit the list of users who have access permissions for managing the application via the Kaspersky Security Service.

The **Permissions for Kaspersky Embedded Systems Security** group window opens.

5. In the window that opens, in the **Group or user names** list, select the user or group of users whose permissions you want to change.

6. In the **Permissions for <User (Group)>** section, select the **Allow** or **Deny** check boxes for the following access levels:

- **Full control:** full set of permissions to manage Kaspersky Embedded Systems Security or the Kaspersky Security Service.
- **Read:**
  - The following permissions to manage Kaspersky Embedded Systems Security: **Retrieve statistics, Read settings, Read logs** and **Read permissions**.
  - The following permissions to manage the Kaspersky Security Service: **Read service settings, Request status from Service Control Manager, Request status from service, Read list of dependent services, Read permissions**.
- **Modification:**
  - All permissions to manage Kaspersky Embedded Systems Security, except **Edit permissions**.
  - The following permissions to manage the Kaspersky Security Service: **Modify service settings, Read permissions**.
- **Special permissions:** the following permissions to manage the Kaspersky Security Service: **Starting service, Stop service, Pause / Resume service, Read permissions, User defined requests to service**.

7. To configure advanced permissions for a user or group (**Special permissions**), click the **Advanced** button.

- a. In the **Advanced security settings for Kaspersky Embedded Systems Security** window that opens, select the desired user or group.
- b. Click the **Edit** button.
- c. In the drop-down list in the top part of the window, select the type of access control (**Allow** or **Block**).
- d. Select the check boxes next to the functions that you want to allow or block for the selected user or group.
- e. Click **OK**.
- f. In the **Advanced security settings for Kaspersky Embedded Systems Security** window, click **OK**.

8. In the **Permissions for Kaspersky Embedded Systems Security** window, click the **Apply** button.

The configured permissions for managing Kaspersky Embedded Systems Security or the Kaspersky Security Service are saved.

## Password-protected access to Kaspersky Embedded Systems Security functions

You can restrict access to application management and registered services by configuring user permissions. You can also set password protection in the Kaspersky Embedded Systems Security settings for additional protection of critical operations.

Kaspersky Embedded Systems Security requests a password when you attempt to access the following application functions:

- connect to the Application Console;
- uninstall Kaspersky Embedded Systems Security;
- modify Kaspersky Embedded Systems Security components;
- execute command-line commands.

The Kaspersky Embedded Systems Security interface disguises the specified password on screen. Kaspersky Embedded Systems Security stores the password as a checksum calculated when the password is entered.

Kaspersky Embedded Systems Security doesn't check password strength and doesn't block password entry after a number of failed attempts.

When creating a password, you are recommended to meet the following conditions:

- The password doesn't contain the account name or computer name.
- The password is at least 8 characters long.
- The password contains characters that match at least three of the following categories:
  - uppercase latin letters (A-Z);
  - lowercase latin letters (a-z);
  - numbers (0-9);
  - symbols of exclamation point (!), dollar sign (\$), pound sign (#) and percent sign (%).

You can export and import a password-protected application configuration. A configuration file created by exporting a protected application configuration contains the password checksum and the value of the modifier used to pad the password string.

Do not change the checksum or modifier in the configuration file. Importing a password-protected configuration that has been changed manually may cause access to the application to be entirely blocked.

*To protect access to Kaspersky Embedded Systems Security functions:*

1. In the tree of Kaspersky Security Center Administration Console, expand the **Managed devices** node. Select the administration group with the protected devices whose application settings you want to configure.
2. Perform one of the following actions in the details pane of the selected administration group:
  - To configure policy settings for a group of protected devices, select the **Policies** tab and open the properties of the **<Policy name>** by means of the context menu.
  - If you want to configure application settings for a single protected device, open the required settings in the [Application settings](#) window in the Kaspersky Security Center.
3. In the **Security and reliability** section of the **Application settings** tab, click the **Settings** button.  
The **Security settings** window opens.

4. In the **Password protection settings** section, select the **Apply password protection** check box.

The **Password** and **Confirm password** fields become active.

5. In the **Password** field, enter the password you want to use to protect access to Kaspersky Embedded Systems Security functions.

6. In the **Confirm password** field, enter your password again.

7. Click **OK**.

The specified settings are saved. Kaspersky Embedded Systems Security will request the specified password to access protected functions.

This password cannot be recovered. Losing your password will result in the complete loss of control of the application. Additionally, it will be impossible to uninstall the application from the protected device.

You can reset the password at any time. To do that, clear the **Apply password protection** check box and save changes. Password protection will be disabled and the old password checksum will be removed. Repeat the password creation process with a new password.

## Managing access permissions via the Application Console

In this section, learn how to navigate the Application Console interface and configure access permissions on a protected device.

### Configuring access permissions for managing Kaspersky Embedded Systems Security and the Kaspersky Security Service

You can edit the list of users and user groups allowed to access Kaspersky Embedded Systems Security functions and manage the Kaspersky Security Service. You can also edit the access permissions of those users and user groups.

*To add or remove a user or group from the list:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Supplementary** section, perform one of the following steps:

- Click **Settings** in the **User access permissions for application management** subsection if you want to edit the list of users who have access permissions for managing Kaspersky Embedded Systems Security functions.
- Click **Settings** in the **User access permissions for Kaspersky Security Service management** subsection if you want to edit the list of users who have access permissions for managing the Kaspersky Security Service.

The **Permissions for Kaspersky Embedded Systems Security 3.2** group window opens.

5. In the window that opens, perform the following operations:

- In order to add a user or group to the list, click the **Add** button and select the user or group that you want to grant privileges to.
- To remove a user or group from the list, select the user or group whose access you want to restrict, and click the **Remove** button.

6. Click the **Apply** button.

The selected users (groups) are added or removed.

*To edit a user's or group's permissions to manage Kaspersky Embedded Systems Security or the Kaspersky Security Service:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.

2. Select the administration group for which you want to configure application settings.

3. Perform one of the following actions in the details pane of the selected administration group:

- To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
- To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Supplementary** section, perform one of the following steps:

- Click **Settings** in the **User access permissions for application management** subsection if you want to edit the list of users who have access permissions for managing Kaspersky Embedded Systems Security functions.
- Click **Settings** in the **User access permissions for Kaspersky Security Service management** subsection if you want to edit the list of users who have access permissions for managing the application via the Kaspersky Security Service.

The **Permissions for Kaspersky Embedded Systems Security** group window opens.

5. In the window that opens, in the **Group or user names** list, select the user or group of users whose permissions you want to change.

6. In the **Permissions for <User (Group)>** section, select the **Allow** or **Deny** check boxes for the following access levels:

- **Full control:** full set of permissions to manage Kaspersky Embedded Systems Security or the Kaspersky Security Service.
- **Read:**
  - The following permissions to manage Kaspersky Embedded Systems Security: **Retrieve statistics, Read settings, Read logs** and **Read permissions**.
  - The following permissions to manage the Kaspersky Security Service: **Read service settings, Request status from Service Control Manager, Request status from service, Read list of dependent services, Read permissions**.
- **Modification:**
  - All permissions to manage Kaspersky Embedded Systems Security, except **Edit permissions**.
  - The following permissions to manage the Kaspersky Security Service: **Modify service settings, Read permissions**.
- **Special permissions:** the following permissions to manage the Kaspersky Security Service: **Starting service, Stop service, Pause / Resume service, Read permissions, User defined requests to service**.

7. To configure advanced permissions for a user or group (**Special permissions**), click the **Advanced** button.

- a. In the **Advanced security settings for Kaspersky Embedded Systems Security** window that opens, select the desired user or group.
- b. Click the **Edit** button.
- c. In the drop-down list in the top part of the window, select the type of access control (**Allow** or **Block**).
- d. Select the check boxes next to the functions that you want to allow or block for the selected user or group.
- e. Click **OK**.
- f. In the **Advanced security settings for Kaspersky Embedded Systems Security** window, click **OK**.

8. In the **Permissions for Kaspersky Embedded Systems Security** window, click the **Apply** button.

9. The configured permissions for managing Kaspersky Embedded Systems Security or the Kaspersky Security Service are saved.

## Password-protected access to Kaspersky Embedded Systems Security functions

You can restrict access to application management and registered services by configuring user permissions. You can also set password protection in the Kaspersky Embedded Systems Security settings for additional protection of critical operations.

Kaspersky Embedded Systems Security requests a password when you attempt to access the following application functions:

- connect to the Application Console;
- uninstall Kaspersky Embedded Systems Security;
- modify Kaspersky Embedded Systems Security components;
- execute command-line commands.

The Kaspersky Embedded Systems Security interface disguises the specified password on screen. Kaspersky Embedded Systems Security stores the password as a checksum calculated when the password is entered.

Kaspersky Embedded Systems Security doesn't check password strength and doesn't block password entry after a number of failed attempts.

When creating a password, you are recommended to meet the following conditions:

- The password doesn't contain the account name or computer name.
- The password is at least 8 characters long.
- The password contains characters that match at least three of the following categories:
  - uppercase latin letters (A-Z);
  - lowercase latin letters (a-z);
  - numbers (0-9);
  - symbols of exclamation point (!), dollar sign (\$), pound sign (#) and percent sign (%).

You can export and import a password-protected application configuration. A configuration file created by exporting a protected application configuration contains the password checksum and the value of the modifier used to pad the password string.

Do not change the checksum or modifier in the configuration file. Importing a password-protected configuration that has been changed manually may cause access to the application to be entirely blocked.

*To protect access to Kaspersky Embedded Systems Security functions:*

1. In the Application Console tree, select the **Kaspersky Embedded Systems Security** node and do one of the following:
  - Click the **Application properties** link in the results pane of the node.
  - Select **Properties** in the node's context menu.

The **Application settings** window opens.

2. On the **Security and reliability** tab in the **Password protection settings** section, select the **Apply password protection** check box.

The **Password** and **Confirm password** fields become active.

3. In the **Password** field, enter the password you want to use to protect access to Kaspersky Embedded Systems Security functions.
4. In the **Confirm password** field, enter the password again.
5. Click **OK**.

This password cannot be recovered. Losing your password results in complete loss of control of the application. Additionally, it will be impossible to uninstall the application from the protected device.

You can reset the password at any time. To do that, clear the **Apply password protection** check box and save changes. Password protection will be disabled and the old password checksum will be removed. Repeat the password creation process with a new password.

## Managing access permissions via the Web Plug-in

In this section, learn how to navigate the Web Plug-In interface and configure access permissions for one or all protected devices on the network.

## Configuring access permissions for Kaspersky Embedded Systems Security and the Kaspersky Security Service

To configure the access permissions for a user or group you need to specify the security descriptor string using the security descriptor definition language (SDDL). For detailed information about the security descriptor string, please visit the Microsoft website.

*To configure the access permissions for a user or group:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **Supplementary** section.
5. Perform one of the following steps:
  - Click **Settings** in the **User access permissions for application management** subsection if you want to edit the list of users who have access permissions for managing Kaspersky Embedded Systems Security functions.
  - Click **Settings** in the **User access permissions for Kaspersky Security Service management** subsection if you want to edit the list of users who have access permissions for managing the Kaspersky Security Service.
6. Add a user or group by specifying the security descriptor string in the **User access permissions for application management** or **User access permissions for Kaspersky Security Service management** window.
7. Click **OK**.

## Password-protected access to Kaspersky Embedded Systems Security functions

You can restrict access to application management and registered services by configuring user permissions. You can also set password protection in the Kaspersky Embedded Systems Security settings for additional protection of critical operations.

Kaspersky Embedded Systems Security requests a password when you attempt to access the following application functions:

- connect to the Application Console;
- uninstall Kaspersky Embedded Systems Security;
- modify Kaspersky Embedded Systems Security components;
- execute command-line commands.

The Kaspersky Embedded Systems Security interface disguises the specified password on screen. Kaspersky Embedded Systems Security stores the password as a checksum calculated when the password is entered.

Kaspersky Embedded Systems Security doesn't check password strength and doesn't block password entry after a number of failed attempts.

When creating a password, you are recommended to meet the following conditions:

- The password doesn't contain the account name or computer name.
- The password is at least 8 characters long.
- The password contains characters that match at least three of the following categories:
  - uppercase latin letters (A-Z);
  - lowercase latin letters (a-z);
  - numbers (0-9);
  - symbols of exclamation point (!), dollar sign (\$), pound sign (#) and percent sign (%).

You can export and import a password-protected application configuration. A configuration file created by exporting a protected application configuration contains the password checksum and the value of the modifier used to pad the password string.

Do not change the checksum or modifier in the configuration file. Importing a password-protected configuration that has been changed manually may cause access to the application to be entirely blocked.

*To protect access to Kaspersky Embedded Systems Security functions:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.

2. Click the policy name you want to configure.
3. In the <Policy name> window that opens select the **Application settings** tab.
4. Select the **Application settings** section.
5. In the **Security and reliability** section, click the **Settings** button.
6. In the **Password protection settings** section, select the **Apply password protection** check box.
7. In the **Password** field, enter the password you want to use to protect access to Kaspersky Embedded Systems Security functions.
8. Click **OK**.

The specified settings are saved. Kaspersky Embedded Systems Security will request the specified password to access protected functions.

This password cannot be recovered. Losing your password will result in the complete loss of control of the application. Additionally, it will be impossible to uninstall the application from the protected device.

You can reset the password at any time. To do that, clear the **Apply password protection** check box and save changes. Password protection will be disabled and the old password checksum will be removed. Repeat the password creation process with a new password.

# Real-Time File Protection

This section contains information about the Real-Time File Protection task and how to configure it.

## About Real-Time File Protection task

When the Real-Time File Protection task is running, Kaspersky Embedded Systems Security scans the following protected device objects when they are accessed:

- Files.
- NTFS alternate data streams.
- Master boot records and boot sectors on local hard drives and external devices.

When any application writes a file to the protected device or reads a file from it, Kaspersky Embedded Systems Security intercepts the file, scans it for threats, and, if a threat is detected, performs a default action or an action you have specified: try to disinfect, move to Quarantine, or delete it. Before disinfection or deletion, Kaspersky Embedded Systems Security saves an encrypted copy of the source file to the Backup folder.

Kaspersky Embedded Systems Security also detects malware for processes running under Windows Subsystem for Linux®. For such processes, the Real-Time File Protection task applies the action defined by the current configuration.

## About the task protection scope and security settings

By default, the Real-Time File Protection task protects all objects of the device file system. If there is no security requirement to protect all objects of the file system or you want to exclude any objects from the task scope, you can limit the protection scope.

In the Application Console, the protection scope is displayed as a tree or list of the device's file resources that Kaspersky Embedded Systems Security can monitor. By default, the network file resources of the device are displayed as a list.

In the Administration Plug-in, only the list view is available.

*To display network file resources as a tree in the Application Console,*

open the drop-down list in the upper left section of the **Protection scope settings** window and select **Tree-view**.

Whether the protected device's file resources are displayed as a list or a tree, the node icons have the following meanings:

- The node is included in the protection scope.
- The node is excluded from the protection scope.
- At least one of this node's child nodes is excluded from the protection scope, or the security settings of the child node(s) differ(s) from those of the parent node (for the tree view only).

The  icon is displayed if all child nodes are selected, but the parent node is not selected. In this case, changes in the composition of the parent node's files and folders are disregarded automatically when the protection scope for the selected child node is created.

Using the Application Console, you can also [add virtual drives](#) to the protection scope. The names of the virtual nodes are displayed in blue.

## Security settings

The task security settings can be configured as common settings for all nodes or items included in the protection scope, or as different settings for each node or item in the device's file resource tree or list.

Security settings configured for the selected parent node are automatically applied to all its child nodes. The security settings of the parent node are not applied to child nodes that are configured separately.

The settings for a selected protection scope can be configured using one of the following methods:

- Selecting one of three [predefined security levels](#).
- [Configuring the security settings manually](#) for the selected nodes or items in the file resource tree or list (the security level changes to **Custom**).

A set of settings for a node or item can be saved in a template in order to be applied later to other nodes or items.

## About virtual protection scopes

Kaspersky Embedded Systems Security can scan not only existing folders and files on hard drives and removable drives, but also drives that are dynamically created on the protected device by various applications and services.

If all device objects are included in the protection scope, these dynamic nodes will automatically be included in the protection scope. However, if you want to specify special values for the security settings of these dynamic nodes or if you have selected only part of the device for protection, then in order to include virtual drives, files or folders in the protection scope, you will first have to create them in the Application Console: that is, specify the virtual protection scope. The drives, files and folders created will exist only in the Application Console, but not in the file structure of the protected device.

If, while creating a protection scope, all subfolders or files are selected without the parent folder being selected, then all virtual folders or files that appear in it will not automatically be included in the protected scope. "Virtual copies" of these should be created in the Application Console and added to the protection scope.

## Predefined protection scopes

The file resource tree or list displays the nodes to which you have read-access based on the configured Microsoft Windows security settings.

Kaspersky Embedded Systems Security covers the following predefined protection scopes:

- **Local hard drives.** Kaspersky Embedded Systems Security protects files on the device hard drives.
- **Removable drives.** Kaspersky Embedded Systems Security protects files on external devices, such as CDs or removable drives. All removable drives, individual disks, folders or files can be included in or excluded from the protection scope.
- **Network.** Kaspersky Embedded Systems Security protects files that are written to network folders or read from them by applications running on the device. Kaspersky Embedded Systems Security does not protect files when such files are accessed by applications from other protected devices.
- **Virtual drives.** Virtual folders, files, and drives temporarily connected to the device can be included in the protection scope, for example, common cluster drives.

By default, you can view and configure predefined protection scopes in the scope list; you can also add predefined scopes to the list during its formation in the protection scope settings.

By default, the protection scope includes all predefined areas except virtual drives.

Virtual drives created using the SUBST command are not displayed in the protected device's file resource tree in the Application Console. To include objects on the virtual drive in the protection scope, include the device folder associated with the virtual drive in the protection scope.

Connected network drives will also not be displayed in the protected device's file resource list. To include objects on network drives in the protection scope, specify the path to the folder that corresponds to this network drive in UNC format.

## About predefined security levels

One of the following predefined security levels for the nodes selected either in the protected device's file resource tree or file resource list can be applied: **Maximum performance**, **Recommended**, and **Maximum protection**. Each of these levels contains its own predefined set of security settings (see the table below).

### Maximum performance

The **Maximum performance** security level is recommended if your network has additional protected device security measures, for example, firewalls and existing security policies, beyond using Kaspersky Embedded Systems Security on protected devices.

### Recommended

The **Recommended** security level ensures the best combination of protection and performance impact on devices. Kaspersky experts recommend this level as adequate to protect devices on most corporate networks. The **Recommended** security level is set by default.

### Maximum protection

The **Maximum protection** security level is recommended if your organization's network has elevated device security requirements.

Options	Security level		
	Maximum performance	Recommended	Maximum protection
<b>Objects protection</b>	By extension	By format	By format
<b>Protect only new and modified files</b>	Enabled	Enabled	Disabled
<b>Action to perform on infected and other objects</b>	Block access and disinfect. Remove if disinfection fails	Notify only	Block access and disinfect. Remove if disinfection fails
<b>Action to perform on probably infected objects</b>	Block access and quarantine	Notify only	Block access and quarantine
<b>Exclude files</b>	No	No	No
<b>Do not detect</b>	No	No	No
<b>Stop scanning if it takes longer than (sec.)</b>	60 sec.	60 sec.	60 sec.
<b>Do not scan compound objects larger than (MB)</b>	8 MB	8 MB	Not set
<b>Scan alternate NTFS streams</b>	Yes	Yes	Yes
<b>Scan disk boot sectors and MBR</b>	Yes	Yes	Yes
<b>Compound objects protection</b>	<ul style="list-style-type: none"> <li>• Packed objects*</li> </ul> *New and modified objects only	<ul style="list-style-type: none"> <li>• SFX archives*</li> <li>• Packed objects*</li> <li>• Embedded OLE objects*</li> </ul> *New and modified objects only	<ul style="list-style-type: none"> <li>• SFX archives*</li> <li>• Packed objects*</li> <li>• Embedded OLE objects*</li> </ul> *All objects
<b>Entirely remove compound file that cannot be modified by the application in case of embedded object detection</b>	No	No	Yes

The **Objects protection**, **Use iChecker technology**, **Use iSwift technology**, and **Use heuristic analyzer** settings are not included in the settings of the predefined security levels. If you edit the **Objects protection**, **Use iChecker technology**, **Use iSwift technology**, or **Use heuristic analyzer** security settings after selecting one of the predefined security levels, the security level that you have selected will not change.

## File extensions scanned by default in the Real-Time File Protection task

Kaspersky Embedded Systems Security scans files with the following extensions by default:

- 386;
- acm;
- ade, adp;
- asp;
- asx;
- ax;
- bas;
- bat;
- bin;
- chm;
- cla, clas\*;
- cmd;
- com;
- cpl;
- crt;
- dll;
- dpl;
- drv;
- dvb;
- dwg;
- efi;
- emf;
- eml;
- exe;
- fon;
- fpm;
- hlp;
- hta;

- *htm, html\**;
- *htt*;
- *ico*;
- *inf*;
- *ini*;
- *ins*;
- *isp*;
- *jpg, jpe*;

## Default Real-Time File Protection task settings

By default, the Real-Time File Protection task uses the settings described in the table below. You can change the values of these settings.

Default Real-Time File Protection task settings

Setting	Default value	Description
Protection scope	The entire protected device, excluding virtual drives.	Use this option to change the protection scope.
Security settings	Common settings for the entire protection scope correspond to the <b>Recommended</b> security level.	For nodes selected in the protected device's file resource list or tree, you can: <ul style="list-style-type: none"> <li>• Select a different predefined security level</li> <li>• Manually change security settings</li> </ul> <p>You can save a group of security settings for a selected node as a template to use later for a different node.</p>
Objects protection mode	<b>Smart mode</b>	Use this option to select the protection mode, i.e. define the type of access attempts for which Kaspersky Embedded Systems Security scans objects.
Heuristic analyzer	The <b>Medium</b> security level is applied.	The Heuristic Analyzer can be enabled or disabled and the analysis level can be configured.
Apply Trusted Zone	Applied.	General list of exclusions that can be used in selected tasks.
Use KSN for protection	Applied.	Use this option to improve your device's protection using the Kaspersky Security Network cloud service (available if the KSN Statement is accepted).
Task start schedule	At application start.	Use this option to configure for scheduled task start.

<b>Block access to network shared resources for the sessions that show malicious activity</b>	Not applied.	Use this option to block current session and to add host IP or host LUID for which malicious activity was detected in the Blocked hosts storage section.
<b>Launch critical areas scan when active infection is detected</b>	Applied.	When active infection is detected, Kaspersky Embedded Systems Security creates and launches a temporary Critical Areas Scan task.

## Managing the Real-Time File Protection task via the Administration Plug-in

In this section, learn how to navigate the Administration Plug-In interface and configure task settings for one or all protected devices on the network.

### Navigation

Learn how to navigate to the required task settings via the chosen interface.

## Opening policy settings for the Real-Time File Protection task

*To open the Real-Time File Protection task settings via the Kaspersky Security Center policy:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Policies** tab.
4. Double-click the policy name you want to configure.
5. In the **Properties: <Policy name>** window that opens, select the **Real-Time Computer Protection** section.
6. Click the **Settings** button in the **Real-Time File Protection** subsection.

The **Real-time file protection** window opens.

If a protected device is being managed by an active Kaspersky Security Center policy and this policy blocks changes to the application settings, these settings cannot be edited via the Application Console.

## Opening the Real-Time File Protection task properties

*To open the Real-Time File Protection task settings window for a single network device:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.

2. Select the administration group for which you want to configure the task.
3. Select the **Devices** tab.
4. Open the **Properties: <Protected device name>** window in one of the following ways:
  - Double-click the name of the protected device.
  - Select the **Properties** item in the context menu of the protected device.

The **Properties: <Protected device name>** window opens.

5. In the **Tasks** section, select the **Real-Time File Protection** task.
6. Click the **Properties** button.  
The **Properties: Real-Time File Protection** window opens.

## Configuring the Real-Time File Protection task

*To configure the Real-Time File Protection task settings:*

1. Open the [Real-time file protection window](#).
2. Configure the following task settings:
  - On the **General** tab:
    - [Interception parameters](#)
    - [Heuristic analyzer](#)
    - [Integration with other components](#)
  - On the **Task management** tab:
    - [Scheduled task start settings](#).
3. Select the **Protection scope** tab and do the following:
  - Click the **Add** or **Edit** button to edit the [protection scope](#).
    - In the window that opens, choose what you want to include in the task protection scope:
      - **Predefined scope**
      - **Disk, folder or network location**
      - **File**
    - Select one of the [predefined security levels](#) or [manually configure the protection](#) settings.
4. Click **OK** in the **Real-time file protection** window.

Kaspersky Embedded Systems Security immediately applies the new settings to a running task. The date and time when the settings were modified, and the values of task settings before and after modification, are saved in the system audit log.

## Selecting the protection mode

In the Real-Time File Protection task, the protection mode can be selected. The **Objects protection mode** section lets you specify the type of access attempts for which Kaspersky Embedded Systems Security scans objects.

The value of the **Objects protection mode** setting applies to the entire protection scope specified in the task. You cannot specify different values for the setting for individual nodes within the protection scope.

*To select the protection mode:*

1. Open the [Real-time file protection window](#).
2. In the window that opens, open the **General** tab and select the protection mode that you want to set:
  - [Smart mode](#)
  - [On access and modification](#)
  - [On access](#)
  - [When run](#)
  - [Deeper analysis of launching processes \(process launch is blocked until the analysis ends\)](#)

3. Click **OK**.

The selected protection mode will take effect.

## Configuring Heuristic Analyzer and integration with other application components

To start the KSN Usage task, you must accept the Kaspersky Security Network Statement.

*To configure Heuristic Analyzer and integration with other components:*

1. Open the [Real-time file protection window](#).
2. On the **General** tab, clear or select the [Use heuristic analyzer](#) check box.
3. If necessary, adjust the level of analysis using the [slider](#).
4. In the **Integration with other components** section, configure the following settings:
  - Select or clear the [Apply Trusted Zone](#) check box.

- Select or clear the [Use KSN for protection](#) check box.

The **Send data about scanned files** check box must be selected in the KSN Usage task settings.

- Select or clear the **Block access to network shared resources for the sessions that show malicious activity** check box.
- Select or clear the [Launch critical areas scan when active infection is detected](#) check box.

5. Click **OK**.

The configured task settings are applied immediately to a running task. If the task is not running, the modified settings are applied at next start.

## Scheduling tasks

You can schedule local system and custom tasks in the Application Console. You cannot schedule group tasks in the Application Console.

*To schedule group tasks using the Administration Plug-in:*

1. In the Kaspersky Security Center Administration Console tree, expand the **Managed devices** node.
2. Select the group that the protected device belongs to.
3. In the results pane, select the **Tasks** tab.
4. Open the **Properties: <Task name>** window in one of the following ways:
  - Double-click the name of the task.
  - Open the context menu of the task name and select the Properties item.
5. Select the **Schedule** section.
6. In the **Schedule settings** block, select the **Run by schedule** check box.

Fields with schedule settings for the On-Demand Scan and Update tasks are unavailable if scheduling of these tasks is blocked by a Kaspersky Security Center policy.

7. Configure schedule settings in accordance with your requirements. To do this, perform the following actions:
  - a. In the **Frequency** list, select one of the following values:
    - **Hourly**, if you want the task to run at intervals of a specified number of hours; specify the number of hours in the **Every <number> hour(s)** field.
    - **Daily**, if you want the task to run at intervals of a specified number of days; specify the number of days in the **Every <number> day(s)** field.
    - **Weekly**, if you want the task to run at intervals of a specified number of weeks; specify the number of weeks in the **Every <number> week(s)** field. Specify the days of the week to start the task (by default

tasks run on Mondays).

- **At application launch**, if you want the task to run every time Kaspersky Embedded Systems Security starts.
- **After application database update**, if you want the task to run after every update of the application databases.

b. Specify the time for the first task start in the **Start time** field.

c. In the **Start date** field, specify the date when the schedule starts.

After you have scheduled the start time, date and frequency of the task, the estimated time for the next start is displayed.

Go to the **Schedule** tab and open the **Task settings** window. In the **Next start** field in the top of the window, the estimated start time is displayed. Each time you open the window, this estimated start time is updated and displayed.

The **Next start** field displays the **Blocked by policy** value if Kaspersky Security Center policy settings prohibit [scheduled local system tasks](#) from starting.

8. Use the **Advanced** tab to configure the following schedule settings in accordance with your requirements.

- In the **Task stop settings** section:
  - a. Select the **Duration** check box and, in the fields to the right, enter the maximum number of hours and minutes of task execution.
  - b. Select the **Pause from** check box and, in the fields to the right, enter the start and end values of a time interval under 24 hours during which task execution will be paused.
- In the **Advanced settings** section:
  - a. Select the **Cancel schedule from** check box and specify the date from which the schedule will cease to apply.
  - b. Select the **Run skipped tasks** check box to enable the start of skipped tasks.
  - c. Select the **Randomize the task start time within the interval of** check box and specify a value in minutes.

9. Click **OK**.

10. Click the **Apply** button to save the task start settings.

If you want to configure application settings for a single task using Kaspersky Security Center, see section "[Configuring local tasks in the Application settings window of the Kaspersky Security Center](#)".

## Creating and configuring the task protection scope

To create and configure the task protection scope via the Kaspersky Security Center:

1. Open the [Real-time file protection window](#).
2. Select the **Protection scope** tab.  
All items already protected by the task are listed in the **Protection scope** table.
3. Click the **Add** button to add new item to the list.  
The **Add objects to protection scope** window opens.
4. Select an object type to add it to a protection scope:
  - **Predefined scope** - to include one of the predefined scopes in the protection scope on the device. Then in the drop-down list, select the desired protection scope.
  - **Disk, folder or network location** - to include individual drive, folder or a network object in the protection scope. Then select the desired protection scope by clicking the **Browse** button.
  - **File** - to include an individual file in the protection scope. Then select the desired protection scope by clicking the **Browse** button.

You cannot add an object to a protection scope if it has already been added as an exclusion from a protection scope.

5. To exclude individual items from the protection scope, clear check boxes next to the names of these items or take the following steps:
  - a. Open the context menu of the protection scope by right-clicking it.
  - b. In the context menu, select the **Add exclusion** option.
  - c. In the **Add exclusion** window, select an object type that you want to add as an exclusion from the protection scope following the procedure used when adding an object to the protection scope.
6. To modify the protection scope or an existing exclusion, select the **Edit scope** option in the context menu of the desired protection scope.
7. To hide a previously added protection scope or an exclusion in the list of network file resources, select the **Remove scope** option in the context menu of the desired protection scope.

A protection scope is removed from the Real-Time File Protection task scope when it is removed from the network file resource list.

8. Click **OK**.

The Protection scope settings window closes. Your newly configured settings are saved.

The **Real-Time File Protection** task can be started if at least one of the device's file resource nodes is included in a protection scope.

## Selecting predefined security levels for On-Demand Scan tasks

You can apply one of the following three predefined security levels to a node selected in the device's file resource list: **Maximum performance**, **Recommended**, and **Maximum protection**.

*To select one of the predefined security levels:*

1. Open the **Properties: Real-Time File Protection** [window](#).
2. Select the **Protection scope** tab.
3. In the protected device's list, select an item included in the protection scope in order to set a predefined security level.
4. Click the **Configure** button.  
The **Real-time file protection settings** window opens.
5. On the **Security level** tab select the security level to be applied.  
The window displays the list of security settings corresponding to the security level selected.
6. Click **OK**.
7. Click **OK** in the **Properties: Real-Time File Protection** window.  
Configured task settings are saved and applied immediately to a running task. If the task is not running, the modified settings are applied at next start.

## Configuring security settings manually

By default, the Real-Time File Protection task uses common security settings for the entire protection scope. These settings correspond to the **Recommended** [predefined security level](#).

The default values of security settings can be modified by configuring them as common settings for the entire protection scope or as different settings for individual items in the device's file resource list or nodes in the tree.

*To configure the security settings of the selected node manually:*

1. Open the [Real-time file protection window](#).
2. On the **Protection scope** tab, select the node whose security settings you want to configure, and click **Configure**.  
The **Real-time file protection settings** window opens.
3. On the **Security level** tab, click the **Settings** button to customize the configuration.
4. You can configure custom security settings for the selected node in accordance with your requirements:

- [General settings](#)
- [Actions](#)
- [Performance](#)

5. Click **OK** in the **Real-time file protection** window.

The new protection scope settings are saved.

## Configuring general task settings

To configure the general security settings of the Real-Time File Protection task:

1. [Open the Real-time file protection settings window.](#)
2. Select the **General** tab.
3. In the **Objects protection** section, specify the objects types that you want to include in the protection scope:
  - [All objects](#)
  - [Objects scanned by format](#)
  - [Objects scanned according to list of extensions specified in anti-virus database](#)
  - [Objects scanned by specified list of extensions](#)
  - [Scan disk boot sectors and MBR](#)
  - [Scan alternate NTFS streams](#)
4. In the **Performance** group box, select or clear the [Protect only new and modified files](#) check box.

To switch between available options when the check box is cleared, click on the **All / Only new** link for each of the compound object types.

5. In the **Compound objects protection** section, specify the compound objects that you want to include in the protection scope:
  - [All](#) / [Only new archives](#)
  - [All](#) / [Only new SFX archives](#)
  - [All](#) / [Only new email databases](#)
  - [All](#) / [Only new packed objects](#)
  - [All](#) / [Only new plain email](#)
  - [All](#) / [Only new embedded OLE objects](#)

6. Click **Save**.

The new task configuration will be saved.

## Configuring actions

*To configure actions on infected and other detected objects during the Real-Time File Protection task:*

1. Open the [Real-time file protection settings](#) window.

2. Select the **Actions** tab.

3. Select the action to be performed on infected and other detected objects:

- [Notify only](#)

- [Block access](#)

- **Perform additional action.**

Select the action from the drop-down list:

- **Disinfect.**

- **Disinfect. Remove if disinfection fails.**

- [Remove](#)

- [Recommended](#)

4. Select the action to be performed on probably infected objects:

- [Notify only](#)

- [Block access](#)

- **Perform additional action.**

Select the action from the drop-down list:

- **Quarantine.**

- [Remove](#)

- [Recommended](#)

5. Configure actions to be performed on objects depending on the type of object detected:

a. Clear or select the [Perform actions depending on the type of object detected](#) check box.

b. Click the **Settings** button.

c. In the window that opens, select a primary action and a secondary action (to be performed if the primary action fails) for each type of detected object.

d. Click **OK**.

6. Select the action to perform on unmodifiable compound files: select or clear the [Entirely remove compound file that cannot be modified by the application in case of embedded object detection](#) check box.

7. Click **Save**.

The new task configuration will be saved.

## Configuring performance

*To configure performance settings for the Real-Time File Protection task:*

1. Open the [Real-time file protection settings](#) window.
2. Select the **Performance** tab.
3. In the **Exclusions** section:
  - Clear or select the [Exclude files](#) check box.
  - Clear or select the [Do not detect](#) check box.
  - Click the **Edit** button for each setting to add exclusions.
4. In the **Advanced settings** section:
  - [Stop scanning if it takes longer than \(sec.\)](#)
  - [Do not scan compound objects larger than \(MB\)](#)
  - [Use iSwift technology](#)
  - [Use iChecker technology](#)

## Managing the Real-Time File Protection task via the Application Console

In this section, you will learn how to navigate the Application Console interface and configure task settings on a protected device.

### Navigation

Learn how to navigate to the required task settings via the chosen interface.

### Opening the Real-Time File Protection task settings

*To open the general task settings window:*

1. In the Application Console tree, expand the **Real-Time Computer Protection** node.
2. Select the **Real-Time File Protection** child node.
3. Click the **Properties** link in the results pane.  
The **Task settings** window opens.

## Opening the Real-Time File Protection task scope settings

*To open the Protection scope settings window for the Real-Time File Protection task:*

1. In the Application Console tree, expand the **Real-Time Computer Protection** node.
2. Select the **Real-Time File Protection** child node.
3. Click the **Configure protection scope** link in the results pane.  
The **Protection scope settings** window opens.

## Configuring the Real-Time File Protection task

*To configure the Real-Time File Protection task settings:*

1. [Open the Task settings window.](#)
2. On the **General** tab, configure the following task settings:
  - [Objects protection mode](#)
  - [Heuristic analyzer](#)
  - [Integration with other components](#)
3. On the **Schedule** and **Advanced** tabs, specify the [scheduled start settings](#).
4. Click **OK** in the **Task settings** window.  
The modified settings are saved.
5. In the results pane of the **Real-Time File Protection** node click the **Configure protection scope** link.
6. Do the following:
  - In the tree or list of the device's file resources, select the nodes or items that you want to be included in the task protection scope.
  - Select one of the [predefined security levels](#) or configure the object [protection settings manually](#).
7. In the **Protection scope settings** window, click the **Save** button.

Kaspersky Embedded Systems Security immediately applies the new settings to a running task. The date and time of the settings modification, and the values of task settings set before and after modification, are saved in the system audit log.

## Selecting protection mode

In the Real-Time File Protection task, the protection mode can be selected. The **Objects protection mode** section lets you specify the type of access attempts for which Kaspersky Embedded Systems Security scans objects.

The value of the **Objects protection mode** setting applies to the entire protection scope specified in the task. You cannot specify different values for the setting for individual nodes within the protection scope.

*To select the protection mode:*

1. [Open the Task settings window.](#)
2. In the window that opens, open the **General** tab and select the protection mode that you want to set:
  - [Smart mode](#)
  - [On access and modification](#)
  - [On access](#)
  - [When run](#)
  - [Deeper analysis of launching processes \(process launch is blocked until the analysis ends\)](#)

3. Click **OK**.

The selected protection mode will take effect.

## Configuring Heuristic Analyzer and integration with other application components

To start the KSN Usage task, you must accept the Kaspersky Security Network Statement.

*To configure Heuristic Analyzer and integration with other components:*

1. Open the [Task settings](#) window.
2. On the **General** tab, clear or select the [Use heuristic analyzer](#) check box.
3. If necessary, adjust the level of analysis using the [slider](#).
4. In the **Integration with other components** section, configure the following settings:
  - Select or clear the [Apply Trusted Zone](#) check box.  
Click the **Trusted Zone** link to open the Trusted Zone settings.

- Select or clear the [Use KSN for protection](#) check box.

The **Send data about scanned files** check box must be selected in the KSN Usage task settings.

- Select or clear the [Block access to network shared resources for the sessions that show malicious activity](#) check box.
- Select or clear the [Launch critical areas scan when active infection is detected](#) check box.

5. Click **OK**.

The newly configured settings will be applied.

## Configuring the task schedule settings

In the Application Console, you can schedule when to start local system and custom tasks. However, you cannot schedule when to start group tasks.

*To schedule a task:*

1. Open the context menu of the task you want to schedule.

2. Select **Properties**.

The **Task settings** window opens.

3. In the window that opens, on the **Schedule** tab, select the **Run by schedule** check box.

4. Follow these steps to specify schedule settings:

a. In the **Frequency** drop-down menu, select one of the following:

- **Hourly**: to run the task at hourly intervals; specify the number of hours in the **Every <number> hour(s)** field.
- **Daily**: to run the task at daily intervals; specify the number of days in the **Every <number> day(s)** field.
- **Weekly**: to run the task at weekly intervals; specify the number of weeks in the **Every <number> week(s) on** field. Specify the days of the week to start the task (by default the task runs on Mondays).
- **At application launch**: to run the task every time Kaspersky Embedded Systems Security starts.
- **After application database update**: to run the task after every update of the application database.

b. In the **Start time** field, specify the time when to start the task for the first time.

c. In the **Start date** field, specify the date when to start the task for the first time.

After you have specified the task start frequency, the time of the first task start, and the date from which the schedule applies, the estimated time for the next task start will appear in the top part of the window in the **Next start** field. The estimated time of the next task start will be updated and displayed each time you open the **Task settings** window on the **Schedule** tab.

The **Next start** field displays the **Blocked by policy** value if Kaspersky Security Center active policy settings prohibit a scheduled local system task from starting.

5. Use the **Advanced** tab to specify the following schedule settings:

- In the **Task stop settings** section:
  - a. Select the **Duration** check box. In the fields to the right, enter maximum task duration in hours and minutes.
  - b. Select the **Pause from** check box. In the fields to the right, enter when to pause and resume the task (under 24 hours).
- In the **Advanced settings** section:
  - a. Select the **Cancel schedule from** check box and specify the task schedule end date.
  - b. Select the **Run skipped tasks** check box to start skipped tasks.
  - c. Select the **Randomize the task start within interval of** check box and specify a value in minutes.

6. Click **OK**.

The task schedule settings are saved.

## Creating a protection scope

This section provides instructions on creating and managing a protection scope in the Real-Time File Protection task.

## Configuring the view for network file resources

*To select the view for network file resources during configuration of protection scope settings:*

1. Open the [Protection scope settings window](#).
2. Open the drop-down list in the upper left section of the window and select one of the following options:
  - Select the **Tree-view** option to display the network file resources as a tree.
  - Select the **List-view** option to display the network file resources as a list.

By default, the network file resources of the protected device are displayed as a list.

3. Click the **Save** button.

## Creating a protection scope

The procedure for creating the Real-Time File Protection task scope depends on the selected [network file resource view](#). You can view the network file resources as a tree or a list (set as default).

To apply the new protection scope settings to the task, the Real-Time File Protection task must be restarted.

*To create a protection scope using the network file resource tree:*

1. Open the [Protection scope settings window](#).
2. In the left section of the window, open the network file resource tree to display all the nodes and child nodes.
3. Do the following:
  - To exclude individual nodes from the protection scope, clear check boxes next to the names of these nodes.
  - To include individual nodes in the protection scope, clear the **My Computer** check box and do the following:
    - If all drives of one type are to be included in the protection scope, select the check box opposite the name of the required disk type (for example, to add all removable drives on the device, select the **Removable drives** check box).
    - If an individual disk of a certain type is to be included in the protection scope, expand the node that contains the list of drives of this type and check the box next to the name of the required drive. For example, in order to select removable drive F:, expand the **Removable drives** node and check the box for **F:** drive.
    - If you would like to include only a single folder or file on the drive, select the check box next to the name of that folder or file.
4. Click the **Save** button.

The **Protection scope settings** window closes. Your newly configured settings are saved.

*To create a protection scope using the network file resources list:*

1. Open the [Protection scope settings window](#).
2. To include individual nodes in the protection scope, clear the **My Computer** check box and do the following:
  - a. Open the context menu of the protection scope by right-clicking it.
  - b. In the context menu of the button, select **Add protection scope**.
  - c. In the **Add protection scope** window select an object type to add it to the protection scope:
    - **Predefined scope** - to include one of the predefined scopes in the protection scope on the device. Then in the drop-down list, select the desired protection scope.
    - **Disk, folder or network location** - to include an individual drive, folder or a network object in the protection scope. Then select the desired scope by clicking the **Browse** button.

- **File** - to include an individual file in the protection scope. Then select the desired scope by clicking the **Browse** button.

You cannot add an object to a protection scope if it has already been added as an exclusion from a protection scope.

3. To exclude individual nodes from the protection scope, clear check boxes next to the names of these nodes or take the following steps:
  - a. Open the context menu of the protection scope by right-clicking it.
  - b. In the context menu, select the **Add exclusion** option.
  - c. In the **Add exclusion** window, select an object type that you want to add as an exclusion from the protection scope following the procedure used when adding an object to the protection scope.
4. To modify the protection scope or an existing exclusion, select the **Edit scope** option in the context menu of the desired protection scope.
5. To hide a previously added protection scope or an exclusion in the list of network file resources, select the **Remove from the list** option in the context menu of the desired protection scope.

A protection scope is removed from the Real-Time File Protection task scope when it is removed from the network file resource list.

6. Click the **Save** button.

The **Protection scope settings** window closes. Your newly configured settings are saved.

The Real-Time File Protection task can be started if at least one of the device's file resource nodes is included in a protection scope.

If a complex protection scope is specified, for example, if different security values for settings for multiple nodes in the device's file resource tree are specified, this may slow the scanning of objects when they are accessed.

## Including network objects in the protection scope

Network drives, folders or files can be added to the protection scope by specifying their path in UNC (Universal Naming Convention) format.

You can scan network folders under the system account.

*To add a network location to the protection scope:*

1. Open the [Protection scope settings window](#).

2. Open the drop-down list in the upper left part of the window and select **Tree-view**.
3. In the context menu of the **Network** node:
  - Select **Add network folder**, if you want to add a network folder to the protection scope.
  - Select **Add network file**, if you want to add a network file to the protection scope.
4. Enter the path to the network folder or file in UNC format.
5. Press the **ENTER** key.
6. Select the check box next to the newly added network object to include it in the protection scope.
7. If necessary, change the security settings for the added network object.
8. Click the **Save** button.

The modified task settings are saved.

## Creating a virtual protection scope

You can expand the protection / scan scope by adding individual virtual drives, folders, or files only if the protection / scan scope is presented as a [tree of file resources](#).

*To add a virtual drive to the protection scope:*

1. Open the [Protection scope settings window](#).
2. Open the drop-down list in the window upper left sector and select **Tree-view**.
3. Open the context menu of the **Virtual drives** node.
4. Select the **Add virtual drive** option.
5. In the list of available names, select the name of the virtual drive that is being created.
6. Select the check box next to the drive to include the drive in the protection scope.
7. In the **Protection scope settings** window, click the **Save** button.

Your newly configured settings are saved.

*To add a virtual folder or virtual file to the protection scope:*

1. Open the [Protection scope settings window](#).
2. Open the drop-down list in the upper left part of the window and select **Tree-view**.
3. Open the context menu of the virtual drive to which you want to add a folder or a file, and select one of the following options:

- **Add virtual folder** - if you want to add a virtual folder to the protection scope.
- **Add virtual file** - if you want to add a virtual file to the protection scope.

4. In the entry field, specify the name of the folder or file.

5. In the line containing the name of the created folder or file, select the check box to include the folder or file in the protection scope.

6. In the **Protection scope settings** window, click the **Save** button.

The modified task settings are saved.

## Configuring security settings manually

By default Real-Time Computer Protection tasks use common security settings for the entire protection scope. These settings correspond to the **Recommended** [predefined security level](#).

The default values of security settings can be modified by configuring them as common settings for the entire protection scope or as different settings for individual items in the device's file resource list or nodes in the tree.

When working with the protected device's file resource tree, security settings that are configured for the selected parent node are automatically applied to all child nodes. The security settings of the parent node are not applied to child nodes that are configured separately.

*To configure security settings manually:*

1. Open the [Protection scope settings window](#).

2. In the left window section select the node to configure security settings.

A predefined [template containing security settings](#) can be applied for a selected node or item in the protection scope.

In the left part of the window, you can [select the view for network file resources](#), [create a protection scope](#), or [create a virtual protection scope](#).

3. In the right part of the window, do one of the following:

- On the **Security level** tab [select the security level](#) to be applied.
- Configure the required security settings of the selected node or item in accordance with your requirements in the following tabs:
  - [General](#)
  - [Actions](#)
  - [Performance](#)

4. In the **Protection scope settings** window, click the **Save** button.

The new protection scope settings are saved.

## Selecting predefined security levels for Real-Time File Protection task

You can apply one of the following three predefined security levels to a node selected in the protected device's file resource tree or list: **Maximum performance**, **Recommended**, and **Maximum protection**.

*To select one of the predefined security levels:*

1. Open the [Protection scope settings window](#).
2. In the protected device's network file resource tree or list, select a node or item to set the predefined security level.
3. Make sure that the selected node or item is included in the protection scope.
4. In the right part of the window, on the **Security level** tab select the security level to be applied.  
The window displays the list of security settings corresponding to the selected security level.
5. Click the **Save** button.  
The task settings are saved and applied immediately to the running task. If the task is not running, the modified settings are applied at the next start.

## Configuring general task settings

*To configure the general security settings of the Real-Time File Protection task:*

1. Open the [Protection scope settings window](#).
2. Select the **General** tab.
3. In the **Objects protection** section, specify the objects that you want to include in the protection scope:
  - [All objects](#)
  - [Objects scanned by format](#)
  - [Objects scanned according to list of extensions specified in anti-virus database](#)
  - [Objects scanned by specified list of extensions](#)
  - [Scan disk boot sectors and MBR](#)
  - [Scan alternate NTFS streams](#)
4. In the **Performance** group box, select or clear the [Protect only new and modified files](#) check box.

To switch between available options when the check box is cleared, click on the **All / Only new** link for each of the compound object types.

5. In the **Compound objects protection** section, specify the compound objects that you want to include in the protection scope:

- [All](#) / [Only new archives](#)
- [All](#) / [Only new SFX archives](#)
- [All](#) / [Only new email databases](#)
- [All](#) / [Only new packed objects](#)
- [All](#) / [Only new plain email](#)
- [All](#) / [Only new embedded OLE objects](#)

6. Click **Save**.

The new task configuration will be saved.

## Configuring actions

*To configure actions on infected and other detected objects for the Real-Time File Protection task:*

1. Open the [Protection scope settings window](#).

2. Select the **Actions** tab.

3. Select the action to be performed on infected and other detected objects:

- [Notify only](#)
- [Block access](#)
- **Perform additional action.**

Select the action from the drop-down list:

- **Disinfect.**
- **Disinfect. Remove if disinfection fails.**
- [Remove](#)
- [Recommended](#)

4. Select the action to be performed on probably infected objects:

- [Notify only](#)
- [Block access](#)
- **Perform additional action.**

Select the action from the drop-down list:

- **Quarantine.**

- [Remove](#) .
- [Recommended](#) .

5. Configure actions to be performed on objects depending on the type of object detected:

- a. Clear or select the [Perform actions depending on the type of object detected](#)  check box.
- b. Click the **Settings** button.
- c. In the window that opens, select a primary action and a secondary action (to be performed if the primary action fails) for each type of detected object.
- d. Click **OK**.

6. Select the action to perform on unmodifiable compound files: select or clear the [Entirely remove compound file that cannot be modified by the application in case of embedded object detection](#)  check box.

7. Click **Save**.

The new task configuration will be saved.

## Configuring performance

*To configure performance settings for the Real-Time File Protection task:*

1. Open the [Protection scope settings window](#).
2. Select the **Performance** tab.
3. In the **Exclusions** section:
  - Clear or select the [Exclude files](#)  check box.
  - Clear or select the [Do not detect](#)  check box.
  - Click the **Edit** button for each setting to add exclusions.
4. In the **Advanced settings** section:
  - [Stop scanning if it takes longer than \(sec.\)](#) .
  - [Do not scan compound objects larger than \(MB\)](#) .
  - [Use iSwift technology](#) .
  - [Use iChecker technology](#) .

## Real-Time File Protection task statistics

When the Real-Time File Protection task is running, you can view detailed real-time information about the number of objects processed by Kaspersky Embedded Systems Security since the task was started.

To view the Real-Time File Protection task statistics:

1. In the Application Console tree, expand the **Real-Time Computer Protection** node.
2. Select the **Real-Time File Protection** child node.

Task statistics are displayed in the **Statistics** section of the results pane of the selected node.

The information can be viewed about objects processed by Kaspersky Embedded Systems Security since it was started (see the table below).

Real-Time File Protection task statistics

Field	Description
<b>Detected</b>	Number of objects detected by Kaspersky Embedded Systems Security. For example, if Kaspersky Embedded Systems Security detects one malicious object in five files, the value in this field increases by one.
<b>Infected and other objects detected</b>	Number of objects that Kaspersky Embedded Systems Security found and classified as infected, or number of found legitimate software files that can be used by intruders to damage your device or personal data.
<b>Probably infected objects detected</b>	Number of objects detected by Kaspersky Embedded Systems Security as probably infected.
<b>Objects not disinfected</b>	Number of objects that Kaspersky Embedded Systems Security did not disinfect for the following reasons: <ul style="list-style-type: none"> <li>• The detected object is of a type that cannot be disinfected.</li> <li>• An error occurred during disinfection.</li> </ul>
<b>Objects not moved to Quarantine</b>	Number of objects that Kaspersky Embedded Systems Security attempted to quarantine unsuccessfully, for example, due to insufficient disk space.
<b>Objects not removed</b>	Number of objects that Kaspersky Embedded Systems Security attempted to delete unsuccessfully, for example, because access to the object was blocked by another application.
<b>Objects not scanned</b>	Number of objects in the protection scope that Kaspersky Embedded Systems Security failed to scan, because, for example, access to the object was blocked by another application.
<b>Objects not backed up</b>	Number of objects whose copies Kaspersky Embedded Systems Security attempted to save in Backup unsuccessfully, for example, due to insufficient disk space.
<b>Processing errors</b>	Number of objects whose processing resulted in an error.
<b>Objects disinfected</b>	Number of objects disinfected by Kaspersky Embedded Systems Security.
<b>Moved to Quarantine</b>	Number of objects quarantined by Kaspersky Embedded Systems Security.
<b>Moved to Backup</b>	Number of objects whose copies Kaspersky Embedded Systems Security saved to Backup.
<b>Objects</b>	Number of objects removed by Kaspersky Embedded Systems Security.

<b>removed</b>	
<b>Password-protected objects</b>	Number of objects (archives, for example) that Kaspersky Embedded Systems Security missed because they were password protected.
<b>Corrupted objects</b>	Number of objects skipped by Kaspersky Embedded Systems Security because their format was corrupted.
<b>Objects processed</b>	Total number of objects processed by Kaspersky Embedded Systems Security.

You can view the Real-Time File Protection task statistics in the task log by clicking the **Open task log** link in the **Management** section in the detail pane.

If the value of the **Total events** field in the Real-Time File Protection task log window exceeds 0, we recommend that you manually process the events in the task log on the **Events** tab.

## Managing Real-Time File Protection task via the Web Plug-in

In this section, learn how to manage the Real-Time File Protection task via the Web Plug-in interface.

### Configuring Real-Time File Protection task

[Predefined security level](#) can not be changed for the Real-Time File Protection task via the Web Plug-in.

*To configure Real-Time File Protection task via the Web Plug-in:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **Real-time computer protection** section.
5. Click **Settings** in the **Real-Time File Protection** subsection.
6. Configure the settings described in the table below.

Real-Time File Protection task settings

<b>Setting</b>	<b>Description</b>
<b>Smart mode</b>	Kaspersky Embedded Systems Security selects objects to be scanned on its own. An object is scanned on being opened and then again after being saved if the object has been modified. If the object is accessed multiple times and modified by the process, Kaspersky Embedded Systems Security rescans the object only after the object is saved by the process for the last time.
<b>On access</b>	Kaspersky Embedded Systems Security scans all objects when they are opened for reading, execution, or modification.

<b>On access and modification</b>	<p>Kaspersky Embedded Systems Security scans an object when it is opened and rescans after it is saved, if the object was modified.</p> <p>This option is selected by default.</p>
<b>When run</b>	<p>Kaspersky Embedded Systems Security scans a file only when it is accessed to be executed.</p>
<u><a href="#">Deeper analysis of launching processes (process launch is blocked until the analysis ends) ?</a></u>	<p>Kaspersky Embedded Systems Security performs longer analysis of launching processes with higher probability to detect a threat. The process launch is blocked until the end of analysis.</p>
<b>Use Heuristic Analyzer</b>	<p>This check box enables / disables Heuristic Analyzer during object scanning.</p> <p>If the check box is selected, Heuristic Analyzer is enabled.</p> <p>If the check box is cleared, Heuristic Analyzer is disabled.</p> <p>The check box is selected by default.</p>
<b>Heuristic analysis level</b>	<p>The heuristic analysis level sets the balance between the thoroughness of searches for threats, the load on the operating system's resources and the time required for scanning.</p> <p>The following scanning sensitivity levels are available:</p> <ul style="list-style-type: none"> <li>• <b>Light.</b> Heuristic Analyzer performs fewer instructions within executable files. The probability of threat detection in this mode is somewhat lower. Scanning is faster and less resource-intensive.</li> <li>• <b>Medium.</b> Heuristic Analyzer performs the number of executable file instructions recommended by Kaspersky experts.</li> </ul> <p>This level is selected by default.</p> <ul style="list-style-type: none"> <li>• <b>Deep.</b> Heuristic Analyzer performs more instructions within executable files. The probability of threat detection in this mode is higher. Scanning uses more system resources, takes more time, and can produce a higher number of false alarms.</li> </ul> <p>The setting is available if the <b>Use heuristic analyzer</b> check box is selected.</p>
<b>Apply Trusted Zone</b>	<p>This check box enables / disables use of the Trusted Zone for a task.</p> <p>If the check box is selected, Kaspersky Embedded Systems Security adds file operations of trusted processes to the scan exclusions configured in the task settings.</p> <p>If the check box is cleared, Kaspersky Embedded Systems Security disregards the file operations of trusted processes when forming the protection scope for the task.</p> <p>The check box is selected by default.</p>
<b>Use KSN for protection</b>	<p>This check box enables or disables the use of KSN services.</p> <p>If the check box is selected, the application uses Kaspersky Security Network data to ensure that the application responds more quickly to new threats and to reduce the likelihood of false positives.</p> <p>If the check box is cleared, the task does not use KSN services.</p> <p>The check box is selected by default.</p>

<p><b>Block access to network shared resources for the network sessions showing malicious activity</b></p>	<p>The check box enables or disables blocking current session and controls the availability of network shared resources in terms of current session.</p> <p>If the check box is selected, Kaspersky Embedded Systems Security blocks current session and, in terms of current session, makes network shared resources unavailable for hosts for which malicious activity was detected in the Blocked hosts storage section</p> <p>If the check box is cleared, conditions are not applied and Kaspersky Embedded Systems Security functions typically.</p> <p>The check box is cleared by default.</p> <p>You can view the list of blocked hosts in the <a href="#">Blocked Hosts storage</a>.</p> <p>You can restore access to blocked hosts, and specify the number of days, hours and minutes after which hosts regain access to network file resources after being blocked by configuring the <a href="#">Blocked Hosts storage settings</a>.</p>
<p><b>Launch critical areas scan when active infection is detected</b></p>	<p>If the check box is selected, when active infection is detected, Kaspersky Embedded Systems Security creates and launches a temporary Critical Areas Scan task. When the Critical Areas Scan temporary task finishes, Kaspersky Embedded Systems Security removes this temporary task.</p> <p>If the check box is cleared, when active infection is detected, Kaspersky Embedded Systems Security does not create and launch Critical Areas Scan task.</p> <p>The check box is selected by default.</p>
<p><b>Protection scope</b></p>	<p>You can <a href="#">configure security settings of the protection scope</a>.</p>

## Configuring the task protection scope

*To configure a protection scope for Real-Time File Protection task:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the <Policy name> window that opens select the **Application settings** tab.
4. Select the **Real-time computer protection** section.
5. Click **Settings** in the **Real-Time File Protection** subsection.
6. Select the **Protection scope** section.
7. Do one of the following:
  - Click **Add** button to add a new rule.
  - Select an existing rule and click **Edit** button.

The **Edit scope** window opens.

8. Switch the toggle button to **Active** and select an object type.

9. In the **Objects protection** section, configure the following settings:

- **Objects protection mode:**
  - [All objects](#)
  - [Objects scanned by format](#)
  - [Objects scanned according to list of extensions specified in anti-virus database](#)
  - [Objects scanned by specified list of extensions](#)
- [Scan disk boot sectors and MBR](#)
- [Scan alternate NTFS streams](#)

10. In the **Objects protection** section, select or clear the [Protect only new and modified files](#) check box.

11. In the **Compound objects protection** section, specify the compound objects that you want to include in the scan scope:

- [Archives](#)
- [SFX archives](#)
- [Packed objects](#)
- [Email databases](#)
- [Plain email](#)
- [Embedded OLE objects](#)
- [Entirely remove compound file that cannot be modified by the application in case of embedded object detection](#)

12. Select the action to be performed on infected and other detected objects:

- [Notify only](#)
- [Block access](#)
- **Perform additional action.**

Select the action from the drop-down list:

- **Disinfect.**
- **Disinfect. Remove if disinfection fails.**
- [Remove](#)
- [Recommended](#)

13. Select the action to be performed on probably infected objects:

- [Notify only](#) ?
- [Block access](#) ?

- **Perform additional action.**

Select the action from the drop-down list:

- Quarantine.
- [Remove](#) ?
- [Recommended](#) ?

14. Configure actions to be performed on objects depending on the type of object detected:

- a. Clear or select the [Perform actions depending on the type of object detected](#) ? check box.
- b. Click the **Settings** button.
- c. In the window that opens, select a primary action and a secondary action (to be performed if the primary action fails) for each type of detected object.
- d. Click **OK**.

15. In the **Exclusions** section, configure the following settings:

- Clear or select the [Exclude files](#) ? check box.
- Clear or select the [Do not detect](#) ? check box.

16. In the **Performance** section, configure the following settings:

- [Stop scanning if it takes longer than \(sec.\)](#) ?
- [Do not scan compound objects larger than \(MB\)](#) ?
- [Use iSwift technology](#) ?
- [Use iChecker technology](#) ?

17. Click the **OK** button.

## KSN Usage

This section contains information about the KSN Usage task and how to configure it.

Updates functionality (including providing anti-virus signature updates and codebase updates), as well as KSN functionality may not be available in the software in the U.S.

### About the KSN Usage task

*Kaspersky Security Network* (also referred to as "KSN") is an infrastructure of online services providing access to Kaspersky's operative knowledge base on the reputation of files, web resources and programs. Kaspersky Security Network allows Kaspersky Embedded Systems Security to react promptly to new threats, improves the performance of several protection components, and reduces the likelihood of false positives.

To start the KSN Usage task, you must accept the Kaspersky Security Network Statement.

Information received by Kaspersky Embedded Systems Security from Kaspersky Security Network pertains only to the reputation of programs.

Participation in KSN allows Kaspersky to receive real-time information about types and sources of new threats, develop ways to neutralize them, and reduce the number of false positives in application components.

More detailed information about the transferring, processing, storage, and destruction of information about application usage is available in the **Data handling** window of the KSN Usage task, and in the [Privacy Policy](#) on the Kaspersky's website.

Participation in Kaspersky Security Network is voluntary. The decision regarding participation in Kaspersky Security Network is made after installation of Kaspersky Embedded Systems Security. You can change your decision about participation in Kaspersky Security Network at any time.

Kaspersky Security Network can be used in the following Kaspersky Embedded Systems Security tasks:

- Real-Time File Protection.
- On-Demand Scan.
- Applications Launch Control.

### Kaspersky Private Security Network

See details about how to configure Kaspersky Private Security Network (hereinafter referred to "Private KSN") in the *Kaspersky Security Center Help*.

If you use Private KSN on the device, in the [Data handling window](#) of the KSN Usage task you can read the KSN Statement and enable the task by selecting the **I accept the terms of participation in Kaspersky Security Network** check box. By accepting the terms you agree to send all types of data mentioned in KSN Statement (security requests, statistical data) to KSN services.

After accepting the Private KSN terms, the check boxes that adjust the Global KSN usage are not available.

If you disable Private KSN when the KSN Usage task is running, the *License violation* error occurs and the task stops. To continue protecting the device you need to accept the KSN Statement in the **Data handling** window and restart the task.

## Withdrawal of the KSN Statement acceptance

You can withdraw the acceptance and stop any data exchange with the Kaspersky Security Network at any moment. The following actions are considered as the full or partial withdrawal of KSN Statement:

- Clearing the **Send data about scanned files** check box: the application stops sending checksums of scanned files to KSN service for analysis.
- Clearing the **Send Kaspersky Security Network statistics** check box: the application stops processing data with additional KSN statistics.
- Clearing the **I accept the terms of participation in Kaspersky Security Network** check box: the application stops all KSN-related data processing, the KSN Usage task stops.
- Uninstalling the KSN Usage component: all KSN-related data processing stops.
- Uninstalling the Kaspersky Embedded Systems Security: all KSN-related data processing stops.
- Uninstalling a license key for the Kaspersky Embedded Systems Security or the license is suspended: all KSN-related data processing stops.

## Default KSN Usage task settings

You can change the default settings of the KSN Usage task (see the table below).

Default KSN Usage task settings

Setting	Default Value	Description
<b>Action to perform on KSN untrusted objects</b>	Remove	You can specify actions that Kaspersky Embedded Systems Security will take on objects identified by KSN as untrusted.
<b>Data transfer</b>	The file checksum (MD5 hash) is calculated for files that do not exceed 2 MB in size.	You can specify the maximum size of files for which a checksum is calculated using the MD5 algorithm for delivery to KSN. If the check box is cleared, Kaspersky Embedded Systems Security calculates the MD5 hash for files of any size.
<b>Task start schedule</b>	First run is not scheduled.	You can start the task manually or configure a scheduled start.

<b>Use Kaspersky Security Center as KSN Proxy</b>	Selected	By default the data is sent to KSN via Kaspersky Security Center. You can change this setting only via the Administration Plug-in.
<b>I accept the terms of participation in Kaspersky Security Network</b>	Cleared	If selected, participation in KSN after the installation is accepted. You can change your decision at any moment.
<b>Send Kaspersky Security Network statistics</b>	Selected (applied only if the KSN Statement is accepted)	If the KSN Statement is accepted, the KSN Statistics will be sent automatically, unless you clear the check box.
<b>Send data about scanned files</b>	Selected (applied only if the KSN Statement is accepted)	If the KSN Statement is accepted, the data about files that were scanned and analyzed since the task has been started, is sent. You can clear the check box at any time.

## Managing KSN Usage via the Administration Plug-In

In this section, learn how configure the KSN Usage task and Data Handling via the Administration Plug-In.

### Configuring the KSN Usage task

*To configure the KSN Usage task:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Real-Time Computer Protection** section, click the **Settings** button in the **KSN Usage** subsection.  
The **KSN Usage** window opens.
5. On the **General** tab, configure the following task settings:

- In the **Action to perform on KSN untrusted objects** section, specify the action that Kaspersky Embedded Systems Security is to perform if it detects an object identified by KSN as untrusted:
  - [Remove](#)
  - [Log information](#)
- In the **Data transfer** section, restrict the size of files for which the checksum is calculated:
  - Clear or select the [Do not calculate checksum before sending to KSN if file size exceeds \(MB\)](#) check box.
  - If required, in the field to the right, change the maximum size of files for which Kaspersky Embedded Systems Security calculates the checksum.
- In the **KSN Proxy** section, clear or select the [Use Kaspersky Security Center as KSN Proxy](#) check box.

To enable KSN Proxy the KSN Statement must be accepted and Kaspersky Security Center properly configured. See *Kaspersky Security Center Help* for more details.

6. If needed, configure the task start schedule on the **Task management** tab. For example, you can start the task by schedule and specify the **At application launch** frequency, if you want the task to run automatically when the protected device is restarted.

The application will automatically start the KSN Usage task by schedule.

7. Configure the [data handling](#) before starting the task.

8. Click **OK**.

The modified settings are applied. The date and time of modifying the settings, as well as information about the task settings before and after modification, are saved in the system audit log.

## Configuring Data Processing

*To configure what data will be processed by the KSN services and accept the KSN Statement:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Real-Time Computer Protection** section click the **Data processing** button in the **KSN Usage** subsection.

The **KSN data handling** window opens.

5. On the **Statistics and services** tab, read the Statement and select the **I accept the terms of participation in Kaspersky Security Network** check box.

6. To increase the protection level, the following check boxes are automatically selected:

- [Send data about scanned files](#)
- [Send Kaspersky Security Network statistics](#)

You can clear these check boxes and stop sending additional data at any moment.

7. The [Send Kaspersky Security Network statistics](#) check box is selected by default. You can clear the check box at any time, if you don't want Kaspersky Embedded Systems Security to send additional statistics to Kaspersky.

8. Click **OK**.

The data processing configuration will be saved.

## Managing KSN Usage via the Application Console

In this section, learn how configure the KSN Usage task and Data handling via the Application Console.

### Configuring KSN Usage task

*To configure the KSN Usage task:*

1. In the Application Console tree, expand the **Real-Time Computer Protection** node.

2. Select the **KSN Usage** child node.

3. Click the **Properties** link in the results pane.

The **Task settings** window opens on the **General** tab.

4. Configure the task:

- In the **Action to perform on KSN untrusted objects** section, specify the action that Kaspersky Embedded Systems Security is to perform if it detects an object identified by KSN as untrusted:
  - [Remove](#)
  - [Log information](#)
- In the **Data transfer** section, restrict the size of files for which the checksum is calculated:
  - Clear or select the [Do not calculate checksum before sending to KSN if file size exceeds \(MB\)](#) check box.

- If required, in the field to the right, change the maximum size of files for which Kaspersky Embedded Systems Security calculates the checksum.

5. If needed, configure the task start schedule on the **Schedule** and **Advanced** tabs. For example, you can enable task start by schedule and specify the start frequency of the **At application launch** if you want the task to run automatically when the protected device is restarted.

The application will automatically start the KSN Usage task by schedule.

6. Configure the [Data handling](#) before starting the task.

7. Click **OK**.

The modified settings are applied. The date and time of modifying the settings, as well as information about the task settings before and after modification, are saved in the system audit log.

## Configuring Data handling

*To configure what data will be processed by the KSN services and accept the KSN Statement:*

1. In the Application Console tree, expand the **Real-Time Computer Protection** node.

2. Select the **KSN Usage** child node.

3. Click the **Data processing** link in the results pane.

The **Data handling** window opens.

4. On the **Statistics and services** tab, read the Statement and select the **I accept the terms of participation in Kaspersky Security Network** check box.

5. To increase the protection level, the following check boxes are automatically selected:

- [Send data about scanned files](#)
- [Send Kaspersky Security Network statistics](#)

You can clear these check boxes and stop sending additional data at any moment.

6. The [Send Kaspersky Security Network statistics](#) check box is selected by default. You can clear the check box at any time, if you don't want Kaspersky Embedded Systems Security to send additional statistics to Kaspersky.

7. Click **OK**.

The data processing configuration will be saved.

## Managing KSN Usage via the Web Plug-in

*To configure the KSN Usage task and Data Handling via the Web Plug-in:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.

2. Click the policy name you want to configure.
3. In the <Policy name> window that opens select the **Application settings** tab.
4. Select the **Real-time computer protection** section.
5. Click **Settings** in the **KSN Usage** subsection.
6. Configure the settings described in the table below.

KSN Usage task and Data Handling via the Administration Plug-In settings

Setting	Description
<b>Remove</b>	<p>Kaspersky Embedded Systems Security deletes the object with KSN-untrusted status and places a copy of it in Backup.</p> <p>This option is selected by default.</p>
<b>Log information</b>	<p>Kaspersky Embedded Systems Security records information about the object with KSN-untrusted status in the task log. Kaspersky Embedded Systems Security does not delete the untrusted object.</p>
<b>Do not calculate checksum before sending to KSN if file size exceeds</b>	<p>This check box enables or disables calculation of the checksum for files of the specified size for delivery of this information to the KSN service.</p> <p>The duration of the checksum calculation depends on the file size.</p> <p>If this check box is selected, Kaspersky Embedded Systems Security does not calculate the checksum for files that exceed the specified size (in MB).</p> <p>If the check box is cleared, Kaspersky Embedded Systems Security calculates the checksum for files of any size.</p> <p>The check box is selected by default.</p>
<b>I confirm that I have fully read, understood, and accept the terms of participation in Kaspersky Security Network</b>	<p>By selecting this check box you confirm that you have read and accepted the terms of the Kaspersky Security Network Statement.</p>
<b>Send data about scanned files</b>	<p>If the check box is selected, Kaspersky Embedded Systems Security sends the checksum of scanned files to the Kaspersky. Conclusion about each file security is based on the reputation received from KSN.</p> <p>If the check box is cleared, Kaspersky Embedded Systems Security does not send checksum of files to KSN.</p> <p>Note, than the file reputation requests might be sent in a limited mode. The limitations are used for protection of the Kaspersky reputation servers from the DDoS attacks. In this scenario, the parameters of file reputation requests, that are being sent, are defined by the rules and methods established by the Kaspersky experts and cannot be configured by user on a protected device. Updates of these rules and methods are received along with the application database updates. If the limitations are applied, the <i>enabled by Kaspersky for protecting KSN servers against DDoS</i> status is displayed in the KSN Usage task statistics.</p> <p>The check box is selected by default.</p>

<b>Agree to process data as a part of the Kaspersky Security Network statistics</b>	<p>If the check box is selected the Kaspersky Embedded Systems Security sends additional statistics, which may contain personal data. The list of all data, that is sent as KSN statistics, is specified in the KSN Statement. The data received by Kaspersky is used to improve the quality of applications and level of threat detection rates.</p> <p>If the check box is cleared, Kaspersky Embedded Systems Security does not send additional statistics.</p> <p>The check box is selected by default.</p>
Task management	You can configure settings to start the task on a schedule.

## Configuring additional data transfer

Kaspersky Embedded Systems Security can be configured to send the following data to Kaspersky:

- Checksums of scanned files (**Send data about scanned files** check box).
- Additional statistics, including personal data (**Send Kaspersky Security Network statistics** check box).

See the "Local data handling" section of this guide for detailed information about data that is sent to Kaspersky.

The corresponding check boxes can be [selected or cleared](#) only if the **I accept the terms of participation in Kaspersky Security Network** check box is selected.

By default Kaspersky Embedded Systems Security sends checksums of files and additional statistics after you accept the KSN Statement.

The **I accept the terms of participation in Kaspersky Security Network** check box is not editable only if the Kaspersky Security Center policy blocks changes of the data handling settings.

Possible check box states and corresponding conditions

Check box state	Conditions for the Send data about scanned files check box state	Conditions for the Send Kaspersky Security Network statistics check box state	Conditions for the I accept the terms of participation in Kaspersky Security Network check box state

## KSN Usage task statistics

While the KSN Usage task is being executed, detailed information can be viewed in real time about the number of objects processed by Kaspersky Embedded Systems Security since it was started up till now. Information about all events that occur during the task performing is recorded in the [task log](#).

To view KSN Usage task statistics:

1. In the Application Console tree, expand the **Real-Time Computer Protection** node.
2. Select the **KSN Usage** child node.

Task statistics are displayed in the **Statistics** section of the details pane of the selected node.

You can view information about objects processed by Kaspersky Embedded Systems Security since the task was started (see the table below).

KSN Usage task statistics

Field	Description
<b>Request sending errors</b>	Number of KSN requests whose processing resulted in a task error.
<b>Statistics formed</b>	Number of generated statistic packages sent to KSN.
<b>Objects removed</b>	Number of objects that Kaspersky Embedded Systems Security deleted when running the KSN Usage task.
<b>Moved to Backup</b>	The number of object copies that Kaspersky Embedded Systems Security saved to Backup.
<b>Objects not removed</b>	The number of objects that Kaspersky Embedded Systems Security attempted but was unable to delete, because, for example, access to the object was blocked by another application. Information about such objects is recorded in the task log.
<b>Objects not backed up</b>	The number of objects the copies of which Kaspersky Embedded Systems Security attempted to save in Backup but was unable to do so, for example, due to insufficient disk space. The application does not disinfect or delete files that it could not move to Backup. Information about such objects is recorded in the task log.
<b>Limited</b>	The status signifies whether the application sends file reputation requests in a limited mode. In

**mode**

a limited mode Kaspersky Embedded Systems Security sends only a part of file reputation requests according to Kaspersky experts recommendation.

# Network Threat Protection

This section contains information about the Network Threat Protection task and how to configure it.

## About the Network Threat Protection task

The Network Threat Protection can only be installed on a device running Microsoft Windows 7 and any later version or Windows Server 2008 R2 and any later version.

The Network Threat Protection task scans inbound network traffic for activity that is typical of network attacks. Upon detecting an attempted network attack that targets your computer, Kaspersky Embedded Systems Security blocks network activity from the attacking computer. Your screen then displays a warning stating that a network attack was attempted, and shows information about the attacking computer.

By default, the Network Threat Protection task runs in the **Block connections when attack is detected** mode. In this mode, Kaspersky Embedded Systems Security adds IP addresses of hosts showing activity typical of network attacks to the list of blocked hosts.

You can view the list of blocked hosts in the [Blocked Hosts storage](#).

You can restore access to blocked hosts, and specify the number of days, hours and minutes after which hosts regain access to network file resources after being blocked by configuring the [Blocked Hosts storage settings](#).

The IP addresses of hosts showing activity typical of network attacks are deleted from the list of blocked hosts in the following cases:

- Kaspersky Embedded Systems Security is uninstalled.
- The IP address was deleted manually from the list of blocked hosts.
- Host blocking term has expired.
- The Network Threat Protection task was stopped and the **Don't stop traffic analysis when the task is not running** check boxed is cleared.
- The **Block connections when attack is detected** mode was turned off.

## Default Network Threat Protection task settings

The Network Threat Protection task uses the default settings described in the table below. You can change the values of these settings.

Default Network Threat Protection task settings

Setting	Default value	Description
Processing mode	Block connections when attack is detected	The Network Threat Protection task can be started in <a href="#">Pass-through</a> , <a href="#">Only inform about network attacks</a> or <a href="#">Block connections when attack is detected</a> mode.

		<p>The check box enables or disables adding hosts showing activity typical of network attacks to the list of blocked hosts.</p> <p>If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, logs events about detected activity, and adds IP addresses of hosts showing activity typical of network attacks to the list of blocked hosts.</p> <p>The mode is selected by default.</p> <p>You can view the list of blocked hosts in the <a href="#">Blocked Hosts storage</a>.</p> <p>You can restore access to blocked hosts, and specify the number of days, hours and minutes after which hosts regain access to network file resources after being blocked by configuring the <a href="#">Blocked Hosts storage settings</a>.</p> <p>If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, logs events about detected activity, but doesn't block network activity from the attacking computer.</p> <p>If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, but doesn't log events about detected activity and doesn't block network activity from the attacking computer.</p> <p>For example, you can use this mode in case of a decrease in the protected device's performance.</p>
<b>Exclusions</b>	The exclusion list is not applied.	Specify areas that you want to exclude from the task protection scope.
<b>Schedule settings</b>	By default, the Network Threat Protection task starts automatically when Kaspersky Embedded Systems Security starts.	You can configure the schedule.

## Configuring the Network Threat Protection task via the Application Console

In this section, learn how to manage the Network Threat Protection task via the Application Console interface.

### General task settings

To configure the general task settings:

1. In the Application Console tree, expand the **Real-Time Computer Protection** node.
2. Select the **Network Threat Protection** child node.
3. Click the **Properties** link in the details pane of the **Network Threat Protection** node.  
The **Task settings** window opens.
4. Open the **General** tab.
5. In the **Processing mode** section select the processing mode:

- **[Pass-through](#)**

If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, but doesn't log events about detected activity and doesn't block network activity from the attacking computer.

For example, you can use this mode in case of a decrease in the protected device's performance.

- **[Only inform about network attacks](#)**

If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, logs events about detected activity, but doesn't block network activity from the attacking computer.

- **[Block connections when attack is detected](#)**

The check box enables or disables adding hosts showing activity typical of network attacks to the list of blocked hosts.

If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, logs events about detected activity, and adds IP addresses of hosts showing activity typical of network attacks to the list of blocked hosts.

The mode is selected by default.

You can view the list of blocked hosts in the [Blocked Hosts storage](#).

You can restore access to blocked hosts, and specify the number of days, hours and minutes after which hosts regain access to network file resources after being blocked by configuring the [Blocked Hosts storage settings](#).

6. Select or clear the **[Don't stop traffic analysis when the task is not running](#)** check box.

If this check box is selected, when Network Threat Protection task is stopped, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks and blocks network activity from the attacking computer depending on the selected processing mode.

If this check box is cleared, when Network Threat Protection task is stopped, Kaspersky Embedded Systems Security doesn't scan inbound network traffic for activity that is typical of network attacks and doesn't block network activity from the attacking computer.

The check box is cleared by default.

7. Click **OK**.

## Adding exclusions

To add exclusions for Network Threat Protection task, take the following steps:

1. In the Application Console tree, expand the **Real-Time Computer Protection** node.
2. Select the **Network Threat Protection** child node.
3. Click the **Properties** link in the details pane of the **Network Threat Protection** node.  
The **Task settings** window opens.
4. On the **Exclusions** tab, select the [Do not control excluded IP-addresses](#)  check box.

If this check box is selected, Kaspersky Embedded Systems Security doesn't scan inbound network traffic for excluded IP addresses.

If this check box is cleared, Kaspersky Embedded Systems Security doesn't apply the exclusion list.

5. Specify the IP address and click **Add** button.
6. Click **OK**.

## Configuring the Network Threat Protection task via the Administration Plug-in

In this section, learn how to manage the Network Threat Protection task via the Administration Plug-in interface.

### General task settings

To configure the general task settings:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Real-Time Computer Protection** section, click the **Settings** button in the **Network Threat Protection** subsection.

The **Network Threat Protection** window opens.

5. Open the **General** tab.

6. In the **Processing mode** section select the processing mode:

- **[Pass-through](#)** 

If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, but doesn't log events about detected activity and doesn't block network activity from the attacking computer.

For example, you can use this mode in case of a decrease in the protected device's performance.

- **[Only inform about network attacks](#)** 

If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, logs events about detected activity, but doesn't block network activity from the attacking computer.

- **[Block connections when attack is detected](#)** 

The check box enables or disables adding hosts showing activity typical of network attacks to the list of blocked hosts.

If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, logs events about detected activity, and adds IP addresses of hosts showing activity typical of network attacks to the list of blocked hosts.

The mode is selected by default.

You can view the list of blocked hosts in the [Blocked Hosts storage](#).

You can restore access to blocked hosts, and specify the number of days, hours and minutes after which hosts regain access to network file resources after being blocked by configuring the [Blocked Hosts storage settings](#).

7. Select or clear the **[Don't stop traffic analysis when the task is not running](#)**  check box.

If this check box is selected, when Network Threat Protection task is stopped, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks and blocks network activity from the attacking computer depending on the selected processing mode.

If this check box is cleared, when Network Threat Protection task is stopped, Kaspersky Embedded Systems Security doesn't scan inbound network traffic for activity that is typical of network attacks and doesn't block network activity from the attacking computer.

The check box is cleared by default.

8. Click **OK**.

## Adding exclusions

To add exclusions for Network Threat Protection task, take the following steps:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Real-Time Computer Protection** section, click the **Settings** button in the **Network Threat Protection** subsection.

The **Network Threat Protection** window opens.

5. On the **Exclusions** tab, select the [Do not control excluded IP-addresses](#)  check box.

If this check box is selected, Kaspersky Embedded Systems Security doesn't scan inbound network traffic for excluded IP addresses.

If this check box is cleared, Kaspersky Embedded Systems Security doesn't apply the exclusion list.

6. Specify the IP address and click **Add** button.

7. Click **OK**.

## Configuring the Network Threat Protection task via the Web Plug-in

In this section, learn how to manage the Network Threat Protection task via the Web Plug-in interface.

### General task settings

To configure the general task settings:

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **Real-time computer protection** section.
5. Click **Settings** in the **Network Threat Protection** subsection.

6. Open the **General** tab.

7. In the **Processing mode** section select the processing mode:

- **[Pass-through](#)** 

If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, but doesn't log events about detected activity and doesn't block network activity from the attacking computer.

For example, you can use this mode in case of a decrease in the protected device's performance.

- **[Only inform about network attacks](#)** 

If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, logs events about detected activity, but doesn't block network activity from the attacking computer.

- **[Block connections when attack is detected](#)** 

The check box enables or disables adding hosts showing activity typical of network attacks to the list of blocked hosts.

If this mode is selected, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks, logs events about detected activity, and adds IP addresses of hosts showing activity typical of network attacks to the list of blocked hosts.

The mode is selected by default.

You can view the list of blocked hosts in the [Blocked Hosts storage](#).

You can restore access to blocked hosts, and specify the number of days, hours and minutes after which hosts regain access to network file resources after being blocked by configuring the [Blocked Hosts storage settings](#).

8. Select or clear the **[Don't stop traffic analysis when the task is not running](#)**  check box.

If this check box is selected, when Network Threat Protection task is stopped, Kaspersky Embedded Systems Security scans inbound network traffic for activity that is typical of network attacks and blocks network activity from the attacking computer depending on the selected processing mode.

If this check box is cleared, when Network Threat Protection task is stopped, Kaspersky Embedded Systems Security doesn't scan inbound network traffic for activity that is typical of network attacks and doesn't block network activity from the attacking computer.

The check box is cleared by default.

9. Click **OK**.

## Adding exclusions

*To add exclusions for Network Threat Protection task, take the following steps:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.

2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **Real-time computer protection** section.
5. Click **Settings** in the **Network Threat Protection** subsection.
6. On the **Exclusions** tab, select the **Do not control excluded IP-addresses**  check box.

If this check box is selected, Kaspersky Embedded Systems Security doesn't scan inbound network traffic for excluded IP addresses.

If this check box is cleared, Kaspersky Embedded Systems Security doesn't apply the exclusion list.

7. Specify the IP address and click **Add** button.
8. Click **OK**.

# Applications Launch Control

This section contains information about the Applications Launch Control task and how to configure it.

## About the Applications Launch Control task

When running the Applications Launch Control task, Kaspersky Embedded Systems Security monitors user's attempts to start applications and allows or denies start of these applications. The Applications Launch Control task relies on the Default Deny principle, which means that any applications that are not allowed in the task settings will be blocked automatically.

You can allow applications to start using one of the following methods:

- Set allowing rules for trusted applications.
- Check trusted applications reputation in KSN on launch.

The task gives top priority to denying the start of applications. For example, if an application is prevented from starting by one of the blocking rules, the application start will be denied regardless of the trusted conclusion for KSN. At that, if the application is not trusted by the KSN services but is included in the scope of an allowing rule, the application start will be denied.

All attempts to start applications are recorded in the [task log](#).

The Applications Launch Control task can operate in one of two modes:

- **Active.** Kaspersky Embedded Systems Security uses a set of rules to control the start of applications that fall within the scope of the Applications Launch Control rules. The scope of the Applications Launch Control rules is specified in the settings of this task. If an application falls within the scope of the Applications Launch Control rules, and the task settings do not satisfy any specified rule, the application launch will be denied.

Launches of applications that do not fall within the scope of any rule specified in the Applications Launch Control task settings are denied regardless of the Applications Launch Control task settings.

The **Applications Launch Control** task cannot be started in Active mode if no rules have been created or if there are more than 65,535 rules for one protected device.

- **Statistics only.** Kaspersky Embedded Systems Security does not use Applications Launch Control rules to allow or deny the start of applications. Instead, it only records information about application starts, rules satisfied by running applications, and actions that would have been performed if the task was running in **Active** mode. All applications are allowed to start. This mode is set by default.

You can use this mode to [create Applications Launch Control rules](#) based on information recorded in the task log.

You can configure the Applications Launch Control task according to one of the following scenarios:

- [Advanced rule configuration](#) and usage for Application Launch Control.
- Basic rules configuration and [KSN usage](#) for Application Launch Control.

If operating system files fall within the scope of the Applications Launch Control task, we recommend that when creating Applications Launch Control rules you make sure that such applications are allowed by the newly created rules. Otherwise, the operating system may fail to start.

Kaspersky Embedded Systems Security also intercepts processes launched under the Windows Subsystem for Linux (except for scripts run from the UNIX™ shell, or command line interpreters). For such processes, the Applications Launch Control task applies the action defined by the current configuration. The Rule Generator for Applications Launch Control task detects application launches and generates corresponding rules for applications running under the Windows Subsystem for Linux.

## About Applications Launch Control rules

### How Applications Launch Control rules work

The operation of Applications Launch Control rules is based on the following components:

- Type of rule.

Applications Launch Control rules can allow or deny the start of application. Accordingly, they are called *allowing* or *denying* rules. To create a list of allowing rules for Applications Launch Control, you can use the Rule Generator for generating allowing rules or use the Applications Launch Control task in **Statistics only** mode. You can also add allowing rules manually.

- User and / or user group.

Applications Launch Control rules can control the start of specified applications by a user and / or user group.

- Rule usage scope.

Applications Launch Control rules can be applied to *executable files, scripts, and MSI packages*.

- Rule-triggering criterion.

Applications Launch Control rules control the launch of files that satisfy one or several of the criteria specified in the rule settings: signed by the specified *digital certificate*, matching the specified *SHA256 hash*, located at the specified *path*, and matching the specified *command line* arguments. You should select at least one option. Otherwise, the Application Launch Control rule is not added.

If **Digital certificate** is set as the rule-triggering criterion, the created rule controls the start of all trusted applications in the operating system. You can set stricter conditions for this criterion by selecting the following check boxes:

- [Use subject](#) 
- [Use thumb](#) 

Thumbprints allow for the most restrictive triggering of application start rules based on a digital certificate, because a thumbprint uniquely identifies a digital certificate and cannot be forged, unlike the subject of a digital certificate.

You can specify exclusions for Applications Launch Control rules. Exclusions to Applications Launch Control rules are based on the same criteria used to trigger rules: digital certificate, SHA256 hash, and file path. Exclusions to Applications Launch Control rules may be required for certain allowing rules: for example, if you want to allow users to start applications from the C:\Windows path, while blocking launch of the Regedit.exe file.

If operating system files fall within the scope of the Applications Launch Control task, we recommend that when creating Applications Launch Control rules you make sure that such applications are allowed by the newly created rules. Otherwise, the operating system may fail to start.

## Managing Applications Launch Control rules

You can perform the following actions with Applications Launch Control rules:

- Add rules manually.
- Generate and add rules automatically.
- Remove rules.
- Export rules to file.
- Check selected files for rules that allow execution of these files.
- Filter the rules in the list according to specified criterion.

## About Software Distribution Control

Generating Applications Launch Control rules can be complicated if you also need to control software distribution on a protected device, for example, on protected devices where installed software is periodically automatically updated. In this case, the list of allowing rules must be updated after each software update for newly created files to be considered in the Applications Launch Control task settings. To simplify launch control in software distribution scenarios, you can use the Software Distribution Control subsystem.

A *software distribution package* (hereinafter referred to as “package”) represents a software application to be installed on a protected device. Each package contains at least one application and may also contain individual files, updates, or even an individual command, in addition to applications, particularly when you are installing a software application or update.

The Software Distribution Control subsystem is implemented as an additional list of exclusions. When you add a software distribution package to this list, the application allows these trusted packages to be decompressed and allows software installed or modified by a trusted package to be started automatically. The extracted files can inherit the trusted attribute of the primary distribution package. A *primary distribution package* is a package that has been added to the list of Software Distribution Control exclusions by a user and has become a trusted package.

Kaspersky Embedded Systems Security controls only full software distribution cycles. The application cannot correctly process the launch of files modified by a trusted package if, when the package is started for the first time, software distribution control is turned off or the Application Launch Control component is not installed.

Software distribution control is not available if the **Apply rules to executable files** check box is cleared in the Applications Launch Control task settings.

## Software distribution cache

Kaspersky Embedded Systems Security uses a dynamically generated software distribution cache (“distribution cache”) to establish the relationship between trusted packages and files created during software distribution. When a package is first started, Kaspersky Embedded Systems Security detects all files created by the package during the software distribution process and stores file checksums and paths in the distribution cache. Then all files in the distribution cache are allowed to start by default.

You cannot review, clear or manually modify the distribution cache via the user interface. The cache is populated and controlled by Kaspersky Embedded Systems Security.

You can export the distribution cache to a configuration file (XML format) and clear the cache using command line options.

*To export the distribution cache to a configuration file, execute the following command:*

```
kavshell appcontrol /config /savetofile:<full path> /sdc
```

*To clear the distribution cache, execute the following command:*

```
kavshell appcontrol /config /clearsdc
```

Kaspersky Embedded Systems Security updates the distribution cache every 24 hours. If the checksum of a previously allowed file is changed, the application deletes the record for this file from the distribution cache. If the Applications Launch Control task is started in Active mode, subsequent attempts to start this file will be blocked. If the full path to the previously allowed file is changed, subsequent attempts to start this file will not be blocked, because the checksum is stored within the distribution cache.

## Processing the extracted files

All files extracted from a trusted package inherit the trusted attribute upon first launch of the package. If you clear the check box after first launch, all files extracted from the package will retain the inherited attribute. To reset the inherited attribute on all extracted files, you need to clear the distribution cache and clear the **Allow the further distribution of programs created from this distribution package** check box before starting the trusted distribution package again.

Extracted files and packages created by a trusted primary distribution package inherit the trusted attribute when their checksums are added to the distribution cache when the software distribution package in the exclusion list is opened for the first time. Hence, the distribution package itself and all files extracted from this package will also be trusted. By default, the number of levels of inheritance of the trusted attribute is unlimited.

Extracted files will retain the trusted attribute after the operating system restarts.

The processing of files is configured in the [Software Distribution Control settings](#) by selecting or clearing the **Allow the further distribution of programs created from this distribution package** check box.

For example, suppose you add a test.msi package containing several other packages and applications to the exclusions list and select the check box. In this case, all packages and applications contained in the test.msi package are allowed to run or be extracted if they contain other files. This scenario works for extracted files on all nested levels.

If you add a test.msi package to the exclusions list and clear the **Allow the further distribution of programs created from this distribution package** check box, the application will assign the trusted attribute only to the packages and executable files extracted directly from the primary trusted package (on the first level of nesting). The checksums of such files are stored in the distribution cache. All files on the second level of nesting and beyond will be blocked by the Default Deny principle.

## Working with the Applications Launch Control rule list

The list of trusted packages of software distribution control subsystem is a list of exclusions, which amplifies, but does not replace the general list of applications launch control rules.

Denying applications launch control rules have the highest priority: trusted package decompression and start of new or modified files will be blocked, if these packages and files are affected by the applications launch control denying rules.

Software distribution control exclusions are applied both for trusted packages and files created or modified by these packages, if no denying rules in the applications launch control list are applied for those packages and files.

## Using KSN conclusions

KSN conclusions that a file is untrusted have a higher priority than the software distribution control exclusions: decompression of trusted packages and start of files created or modified by these packages will be blocked if KSN reports that these files are untrusted.

At that, after unpacking from a trusted package, all child files will be allowed to run regardless of KSN usage within the Applications Launch Control scope. At that, states of **Deny applications untrusted by KSN** and **Allow applications trusted by KSN** check boxes do not affect the operation of the **Allow the further distribution of programs created from this distribution package** check box.

## About KSN usage for the Applications Launch Control task

To start the KSN Usage task, you must accept the KSN Statement.

If KSN data about an application's reputation is used by the Applications Launch Control task, the KSN application reputation is considered a criterion for allowing or denying launch of that application. If KSN reports to Kaspersky Embedded Systems Security that an application is untrusted when the user attempts to launch the application, the application launch is denied. If KSN reports to Kaspersky Embedded Systems Security that the application is trusted when the user attempts to launch the application, the application launch is allowed. KSN can be used along with Applications Launch Control rules or as an independent criterion for denying launch of applications.

## Using KSN conclusions as independent criterion for denying application launch

This scenario lets you securely control application launches on a protected device without requiring advanced configuration of the rule list.

You can apply KSN conclusions to Kaspersky Embedded Systems Security together with the only specified rule. The application will only allow the start of applications that are trusted in KSN or are allowed by a specified rule.

For such a scenario, we recommend that you set a rule allowing start of the application based on a digital certificate.

All other applications are denied in accordance with the Default Deny policy. Using KSN when no rules are applied protects a device from applications that KSN considers to be a threat.

## Using KSN conclusions simultaneously with Applications Launch Control rules

When using KSN conclusions simultaneously with Applications Launch Control rules, the following conditions apply:

- Kaspersky Embedded Systems Security always denies launch of an application if it is included in the scope of at least one denying rule. If the application is considered trusted by KSN, the corresponding conclusion has a lower priority and is not considered; the application launch will still be denied. This lets you expand the list of blocked applications.
- Kaspersky Embedded Systems Security always denies the launch of an application if the launch of applications not trusted in KSN is prohibited and the application is not trusted in KSN. If an allowing rule is set for the application, it has a lower priority and is not considered; the application launch will still be denied. This protects the device from applications that KSN considers to be a threat but were not considered during initial configuration of the rules.

## About Applications Launch Control rules generation

You can create lists of Applications Launch Control rules using Kaspersky Security Center tasks and policies simultaneously for all protected devices and groups of protected devices on the corporate network. The scenarios listed below are recommended if the corporate network does not have a reference machine and you are unable to create a list of allowing rules based on applications installed on the template machine.

You can run the Rule Generator for Applications Launch Control task locally via the Application Console to create a list of rules based on the applications running on a single protected device.

The Applications Launch Control component is installed with two preset allowing rules:

- Allowing rule for scripts and Windows Installer packages with a certificate trusted by the operating system.
- Allowing rule for executable files with a certificate trusted by the operating system.

You can create lists of Applications Launch Control rules on the side of Kaspersky Security Center in one of the following ways:

- Using a Rule Generator for Applications Launch Control group task.

Under this scenario, a group task generates its own list of Applications Launch Control rules for each protected device on the network and saves those lists to an XML file in the specified shared folder. The XML file generated by the Rule Generator for Applications Launch Control task contains the allowing rules specified in task settings before the task starts. No rules will be created for applications that are not allowed to start in the specified task settings. The start of such applications is denied by default. You can then manually import the created list of rules into the Applications Launch Control task for the Kaspersky Security Center policy.

You can configure the generated rules to be automatically imported into the list of rules for the Applications Launch Control task.

This scenario is recommended when you need to quickly create lists of Applications Launch Control rules. We recommend that you configure the scheduled launch of the Rule Generator for Applications Launch Control task only if the applied allowing rules include folders and files you know to be safe.

Before using the Applications Launch Control task in the network, make sure that all protected devices have access to a shared folder. If the organization's policy does not provide for the use of a shared folder in the network, we recommend that you start the Rule Generator for Applications Launch Control task on a protected device in the test protected devices group or on a template machine.

- Based on a report of task events generated in Kaspersky Security Center by the Applications Launch Control task running in **Statistics only** mode.

Under this scenario, Kaspersky Embedded Systems Security does not deny the launch of applications. Instead, with Applications Launch Control running in the **Statistics only** mode, it reports all allowed and denied application launches across all network protected devices in the **Events** tab of the Administration Server node's workspace in the Kaspersky Security Center. Kaspersky Security Center uses the reports to generate a single list of events in which application launches were denied.

You need to configure the task execution period so that all possible scenarios involving the protected devices and protected device groups, and at least one protected device restart are performed during the specified time period. After the end of the task execution period, you can import application launch data from the saved Kaspersky Security Center event report (TXT format) and generate Applications Launch Control allowing rules for such applications based on this data.

This scenario is recommended if a corporate network includes a large number of protected devices of different type (with a different software installed).

- Based on denied application launch events received through Kaspersky Security Center, without creating and importing a configuration file.

To use this feature, the Applications Launch Control task on the protected device must be running under an active Kaspersky Security Center policy. In this case, all events on the protected device are sent to the Administration Server.

We recommend that you update the list of rules when the set of applications installed on network protected devices changes (for example, when updates are installed or operating systems are reinstalled). We recommend that you generate an updated list of rules by running the Rule Generator for Applications Launch Control task or the Applications Launch Control task in **Statistics only** mode on protected devices in the test administration group. The test administration group includes the protected devices required to test the launch of new applications before they are installed on network protected devices.

XML files containing lists of allowing rules are created based on an analysis of tasks started on the protected device. To account for all applications used on the network when generating lists of rules you are advised to start the Rule Generator for Applications Launch Control task and the Applications Launch Control task in **Statistics only** mode on a template machine.

Before generating allowing rules based on the applications launched on a reference machine, make sure that the template machine is secure and there is no malware on it.

Before adding allowing rules, select one of the available rule application modes. The list of Kaspersky Security Center policy rules displays only rules specified by the policy, regardless of the rule application mode. The local rule list includes all applied rules — both local rules and rules added through a policy.

## Default Applications Launch Control task settings

By default, the Applications Launch Control task has the settings described in the table below. You can change the values of these settings.

Default Applications Launch Control task settings

Setting	Default value	Description
<b>Task mode</b>	<b>Statistics only.</b> The task records denied launch events and allowed launch events based on the set rules. Application launch is not actually denied.	You can select <b>Active</b> mode after the final list of rules is generated.
<b>Repeat action taken for the first file launch on all the subsequent launches for this file</b>	Not applied	You can repeat actions taken for the first file launch on all the subsequent launches for this file.
<b>Deny the command interpreters launch with no command to execute</b>	Not applied.	You can deny launch of command interpreters with no command to execute.
<b>Rules managing</b>	<b>Add policy rules to the local rules</b>	You can select a mode in which rules specified in a policy are applied together with the rules on the protected device.
<b>Rule usage scope</b>	The task controls the launch of executable files, scripts, and MSI packages. The task also monitors loading of DLL modules.	You can specify the file types for which launch is controlled by rules.
<b>KSN Usage</b>	KSN application reputation data is not used.	You can use KSN application reputation data when running the Applications Launch Control task.
<b>Automatically allow software distribution via applications and packages listed</b>	Not applied.	You can allow software distribution using the installers and applications specified in the settings. By default, software distribution is only allowed using the Windows Installer service.
<b>Always allow software distribution via Windows Installer</b>	Applied (can be changed only when the <b>Automatically allow software distribution via applications and packages listed</b> setting is enabled).	You can allow any software installation or update if the operations are performed via Windows Installer.
<b>Always allow software distribution via SCCM using the Background Intelligent Transfer Service</b>	Not applied (can be changed only when the <b>Automatically allow software distribution via applications and packages listed</b> setting is enabled).	You can turn on or off automatic software distribution using the System Center Configuration Manager.
<b>Task start</b>	First run is not scheduled.	The Applications Launch Control task does not start automatically at start of Kaspersky Embedded Systems Security. You can start the task manually or configure a scheduled start.

Rule Generator for Applications Launch Control task default settings

Setting	Default Value	Description

Prefix for allowing rules names	Identical to the name of the protected device on which Kaspersky Embedded Systems Security is installed.	You can change the prefix for names of allowing rules.
Allowing rules usage scope	<p>The scope of allowing rules includes the following file categories by default:</p> <ul style="list-style-type: none"> <li>Files with the EXE extension located in the folders C:\Windows, C:\Program Files (x86) and C:\Program Files</li> <li>MSI packages stored in the C:\Windows folder</li> <li>Scripts stored in the C:\Windows folder</li> </ul> <p>The task also creates rules for all running applications, regardless of their location and format.</p>	You can change the protection scope by adding or removing folder paths and specifying the types of files that will be allowed to launch by the automatically generated rules. You can also ignore running applications when creating allowing rules.
Criteria for generation of allowing rules	The digital certificate subject and thumbprint are used; rules are generated for all users and groups of users.	<p>You can use the SHA256 hash when generating allowing rules.</p> <p>You can select a user and group of users for which allowing rules need to be automatically generated.</p>
Actions upon task completion	Allowing rules are added to the list of Applications Launch Control rules; new rules are merged with existing rules; duplicate rules are removed.	You can add rules to the existing rules without merging them and without deleting duplicate rules, or replace existing rules with the new allowing rules, or configure export of the allowing rules to a file.
Task launch settings with permissions	The task is started under a system account.	You can allow the Rule Generator for Applications Launch Control task to start under a system account or using the permissions of a specified user.
Task start schedule	First run is not scheduled.	The Rule Generator for Applications Launch Control task does not start automatically when Kaspersky Embedded Systems Security starts. You can start the task manually or configure a scheduled start.

## Managing Applications Launch Control via the Administration Plug-in

In this section, learn how to navigate the Administration Plug-In interface and configure task settings for one or all protected devices on the network.

### Navigation

Learn how to navigate to the required task settings via the chosen interface.

## Opening policy settings for the Applications Launch Control task

*To open the Applications Launch Control task settings via the Kaspersky Security Center policy:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Policies** tab.
4. Double-click the policy name you want to configure.
5. In the **Properties: <Policy name>** window that opens, select the **Local activity control** section.
6. Click the **Settings** button in the **Applications Launch Control** subsection.  
The **Applications Launch Control** window opens.

Configure the policy as required.

## Opening the Applications Launch Control rules list

*To open the Applications Launch Control rules list via the Kaspersky Security Center:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Policies** tab.
4. Double-click the policy name you want to configure.
5. In the **Properties: <Policy name>** window that opens, select the **Local activity control** section.
6. Click the **Settings** button in the **Applications Launch Control** subsection.  
The **Applications Launch Control** window opens.
7. On the **General** tab, click the **Rules list** button.  
The **Applications Launch Control rules** window opens.

Configure the rules list as required.

## Opening the Rule Generator for Applications Launch Control task wizard and properties

*To start creating a Rule Generator for Applications Launch Control task:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.

2. Select the administration group for which you want to configure the task.
3. Select the **Tasks** tab.
4. Click **Create a task** button.

The **New Task Wizard** window opens.

5. Select the **Rule Generator for Applications Launch Control** task.
6. Click **Next**.

The **Settings** window opens.

*To configure the existing Rule Generator for Applications Launch Control task:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Tasks** tab.
4. Double-click the task name in the list of Kaspersky Security Center tasks.

The **Properties: Rule Generator for Applications Launch Control** window opens.

See the [Configuring the Rule Generator for Applications Launch Control task](#) section for details on configuring the task.

## Configuring Applications Launch Control task settings

*To configure general Applications Launch Control task settings:*

1. Open the [Applications Launch Control](#) window.
2. On the **General** tab, select the following settings in the **Task mode** section:
  - In the [Task mode](#) drop-down list, specify the task mode.
  - Clear or select the [Repeat action taken for the first file launch on all the subsequent launches for this file](#) check box.
  - Clear or select the [Deny the command interpreters launch with no command to execute](#) check box.
3. In the **Rules managing** section, configure settings for applying rules:
  - a. Click the **Rules list** button to add allowing rules for the Applications Launch Control task.

Kaspersky Embedded Systems Security does not recognize paths that contain slashes ("/"). Use backslash ("\") to enter the path correctly.

- b. Select the mode for applying rules:
  - **Replace local rules with policy rules.**

The application applies the rule list specified in the policy for centralized application launch control on a group of protected devices. Local rule lists cannot be created, edited, or applied.

- **Add policy rules to the local rules.**

The application applies the rule list specified in a policy together with local rule lists. You can edit the local rule lists using the Rule Generator for Applications Launch Control task.

4. In the **Rule usage scope** section, specify the following settings:

- [Apply rules to executable files](#)
- [Monitor loading of DLL modules](#)

Controlling loading of DLL modules may affect the performance of the operating system.

- [Apply rules to scripts and MSI packages](#)

5. In the **KSN Usage** group box, configure the following application launch settings:

- [Deny applications untrusted by KSN](#)
- [Allow applications trusted by KSN](#)
- Users and / or user groups allowed to launch applications trusted in KSN.

6. On the **Software Distribution Control** tab, configure the settings for [software distribution control](#).

7. On the **Task management** tab, configure the scheduled [task start settings](#).

8. Click **OK** in the **Applications Launch Control** window.

Kaspersky Embedded Systems Security immediately applies the new settings to the running task. Information about the date and time when the settings were modified, and the values of task settings before and after modification, are saved in the system audit log.

## Configuring Software Distribution Control

*To add a trusted distribution package:*

1. [Open the Applications Launch Control window](#).
2. On the **Software Distribution Control** tab, select the [Automatically allow software distribution via applications and packages listed](#) check box.

You can select the **Automatically allow software distribution via applications and packages listed**, if the **Apply rules to executable files** check box in the **General** tab is selected in the **Applications Launch Control** task settings.

3. Clear the [Always allow software distribution via Windows Installer](#) check box if required.

Clearing the **Always allow software distribution via Windows Installer** check box is only recommended if it is absolutely necessary. Turning off this function may cause issues with updating operating system files and also prevent the launch of files extracted from a distribution package.

4. If required, select the [Always allow software distribution via SCCM using the Background Intelligent Transfer Service](#) check box.

The application controls the software distribution cycle on the protected device – from package delivery to installation or update. The application does not control processes if any stage of distribution was performed before installation of the application on the protected device.

5. To create the allow list or to edit the existing list of trusted distribution packages, click **Change packages list** and select one of the following methods in the window that appears:

- **Add one distribution package.**
  - a. Click the **Browse** button.
  - b. Select the executable file or distribution package.

The **Trusting criteria** section is automatically populated with data about the selected file.
  - c. Clear or select the **Allow the further distribution of programs created from this distribution package** check box.
  - d. Select one of two available options for criteria to use to determine whether a file or distribution package is trusted:
    - **Use digital certificate**
    - **Use SHA256 hash**
- **Add several packages by hash.**

You can select an unlimited number of executable files and distribution packages, and add them to the list all at the same time. Kaspersky Embedded Systems Security examines the hash and allows the operating system to launch the specified files.

- **Change selected package.**

Use this option to select a different executable file or distribution package, or to change the trust criteria.
- [Import distribution packages list from file](#).

In the **Open** window, specify the configuration file containing a list of trusted distribution packages.

6. If you want to remove a previously added application or distribution package for the trusted list, click the **Delete distribution packages** button. Extracted files will be allowed to run.

To prevent extracted files from starting, uninstall the application on the protected device or create a denying rule in the Applications Launch Control task settings.

7. Click **OK**.

Your newly configured settings are saved.

## Configuring the Rule Generator for Applications Launch Control task

To configure the Rule Generator for Applications Launch Control task:

1. Open the [Properties: Rule Generator for Applications Launch Control](#) window.
2. In the **Notification** section, configure the task event notification settings.

For detailed information regarding configuring settings in this section, see the *Kaspersky Security Center Help*.

3. In the **Settings** section, you can configure the following settings:
  - Add prefix for rule names.
  - Select how to create allowing rules:
    - [Create allowing rules based on running applications](#)
    - [Create allowing rules for applications from the folders](#)
4. In the **Options** section, you can specify actions to perform while creating allowing rules for applications launch control:
  - [Use digital certificate](#)
  - [Use digital certificate subject and thumbprint](#)
  - [If the certificate is missing, use](#)
    - **SHA256 hash.** The checksum of the file used to generate the rule is set as a criterion for triggering the allowing rule for Applications Launch Control. The application will allow start of programs launched using files with the specified checksum.
    - **path to file.** The path to the file used to generate the rule is set as a criterion for triggering the allowing rule for Applications Launch Control. The application will now allow start of programs launched using files located in the folders specified in the **Create allowing rules for applications from the folders** table in the **Settings** section.
  - [Use SHA256 hash](#)
  - [Generate rules for user or group of users](#)
5. Configure the task schedule in the **Schedule** section (you can configure a schedule for all task types except Rollback of Database Update).
6. In the **Account** section, specify the account whose rights will be used to run the task.

7. If required, specify the objects to exclude from the task scope in the **Exclusions from task scope** section.

For detailed information on configuring settings in these sections, see *Kaspersky Security Center Help*.

8. In the **Properties: <Task name>** window, click **OK**.

The newly configured group task settings are saved.

## Configuring Applications Launch Control rules via the Kaspersky Security Center

Learn how to generate a list of rules based on various criteria or manually create allowing or denying rules using the Application Launch Control task.

### Adding an Applications Launch Control rule

*To add an Applications Launch Control rule:*

1. [Open the Applications Launch Control rules window](#).

2. Click the **Add** button.

3. In the context menu of the button, select **Add one rule**.

The **Rule settings** window opens.

4. Specify the following settings:

a. In the **Name** field, enter the name of the rule.

b. In the **Type** drop-down list, select the rule type:

- **Allowing** if you want the rule to allow launch of applications in accordance with the criteria specified in the rule settings.
- **Denying** if you want the rule to block launch of applications in accordance with the criteria specified in the rule settings.

c. In the **Scope** drop-down list, select the type of files whose execution will be controlled by the rule:

- **Executable files** if you want the rule to control launch of executable files.
- **Scripts and MSI packages** if you want the rule to control launch of scripts and MSI packages.

d. In the **User or user group** field, specify the users who will be allowed or not allowed to start programs based on the type of rule. To do this, perform the following actions:

1. Click the **Browse** button.

2. The standard Microsoft Windows **Select user or groups** window opens.

3. Specify the list of users and/or user groups.

4. Click **OK**.

e. If you want to take the values of the rule-triggering criteria listed in the **Rule triggering criterion** section from a specific file:

1. Click the **Set rule triggering criterion from file properties** button.

The standard Microsoft Windows **Open** window opens.

2. Select the file.

3. Click the **Open** button.

The criteria values in the file are displayed in the fields in the **Rule triggering criterion** group box. The criterion for which data are available in the file properties is selected by default.

f. In the **Rule triggering criterion** group box, select one or several of the following options as applicable:

- **Digital certificate** if you want the rule to control the start of applications launched using files signed with a digital certificate:
  - Select the **Use subject** check box if you want the rule to control the launch of files signed with a digital certificate only with the specified header.
  - Select the **Use thumb** check box if you want the rule to only control the launch of files signed with a digital certificate with the specified thumbprint.
- **SHA256 hash** if you want the rule to control the start of programs launched using files whose checksum matches the one specified.
- **Path to file** if you want the rule to control the start of programs launched using files located at the specified path.
  - **Command line** if you want the rule to control the start of programs launched using the arguments specified in the command line field. The field is enabled after you select the **Path to file** option. You can use ? and \* characters as a mask when specifying the command line arguments for launched processes as a criterion.

Kaspersky Embedded Systems Security does not recognize paths that contain slashes ("/"). Use backslash ("\") to enter the path correctly.

When specifying the objects, you can use ? and \* characters as file masks.

You should select at least one option. Otherwise, the Application Launch Control rule is not added.

g. If you want to add rule exclusions:

1. In the **Exclusions from rule** section, click the **Add** button.

The **Exclusion from rule** window opens.

2. In the **Name** field, enter the name of the exclusion.

3. Specify the settings for exclusion of application files from the Applications Launch Control rule. You can fill out the settings fields from the file properties by clicking the **Set exclusion based on file properties** button.

- [Digital certificate](#) ?
- [Use subject](#) ?
- [Use thumb](#) ?
- [SHA256 hash](#) ?
- [Path to file](#) ?

4. Click **OK**.

5. If necessary, repeat steps (i)-(iv) to add additional exclusions.

5. Click **OK** in the **Rule settings** window.

The created rule is displayed in the list in the **Applications Launch Control rules** window.

## Enabling the Default Allow mode

Default Allow mode allows all applications to start if they are not blocked by rules or by a conclusion from KSN that they are not trusted. Default Allow mode can be enabled by adding specific allowing rules. You can enable Default Allow for only scripts or for all executable files.

*To add a Default Allow rule:*

1. Open the [Applications Launch Control rules](#) window.

2. Click the **Add** button and, in the button's context menu, select **Add one rule**.

The **Rule settings** window opens.

3. In the **Name** field, enter the name of the rule.

4. In the **Type** drop-down list, select the **Allowing** rule type.

5. In the **Scope** drop-down list, select the type of files whose execution will be controlled by the rule:

- **Executable files** if you want the rule to control the launch of executable files.
- **Scripts and MSI packages** if you want the rule to control the launch of scripts and MSI packages.

6. In the **Rule triggering criterion** group box, select the **Path to file** option.

7. Enter the following mask: `? : \`

8. Click **OK** in the **Rule settings** window.

Kaspersky Embedded Systems Security applies the Default Allow mode.

## Creating allowing rules from Kaspersky Security Center events

*To generate allowing rules for applications from Kaspersky Security Center events in Applications Launch Control:*

1. Open the [Applications Launch Control rules](#) window.
2. Click the **Add** button and, in the button's context menu, select **Create allowing rules for applications from Kaspersky Security Center events**.
3. Select the principle for adding the rules to the list of previously created Application Launch Control rules:
  - **Add to existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are duplicated.
  - **Replace existing rules** if you want to replace the existing rules with the imported rules.
  - **Merge with existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.

The **Applications launch control rules generation** window opens.

4. Select the types of events that you want the rule generation task to use:
  - **Statistics only mode: application launch denied.**
  - **Application launch denied.**
5. Select the time period from the **Request events that were generated within the period** drop-down list.
6. Select or clear the [Prioritize the use of hash when generating rules](#)  check box.

If the check box is selected, Kaspersky Embedded Systems Security uses the checksum of the file to generate the rule when both the checksum and the certificate of the file are available.

If the check box is cleared, Kaspersky Embedded Systems Security uses the digital certificate of the file to generate the rule when both the checksum and the certificate of the file are available.

7. Click the **Generate rules** button.
8. Click the **Save** button in the **Applications Launch Control rules** window.

The rule list in the Applications Launch Control task will be populated with new rules generated based on system data from the protected device with the Kaspersky Security Center Administration Console installed.

If the list of Application Launch Control rules is already specified in the policy, Kaspersky Embedded Systems Security adds the selected rules from the blocking events to the already specified rules. Rules with the same hash are not added, because all rules in the list must be unique.

# Importing rules from a Kaspersky Security Center report on blocked applications

You can import data on blocked application launches from a report generated in Kaspersky Security Center after the Applications Launch Control task is run in **Statistics only** mode and use this data to generate a list of Applications Launch Control allowing rules in the policy being configured.

When generating a report on events occurring during the Applications Launch Control task, you can keep track of the applications whose launch is blocked.

When importing data from a report on blocked applications into policy settings, make sure that the list you are using contains only applications whose launch you want to allow.

*To specify Applications Launch Control allowing rules for a group of protected devices based on a blocked applications report from Kaspersky Security Center:*

1. [Open the Applications Launch Control window](#).
2. In the **Task mode** section, select **Statistics only** mode.
3. In the policy properties in the **Event notification** section, make sure that:
  - For **Critical Events**, the task log retention period for **Application launch denied** events exceeds the planned period for running the task in **Statistics only** mode (the default value is 30 days).
  - For events with an importance level of **Warning**, the task log retention period for **Statistics only mode: application launch denied** events exceeds the planned period for running the task in **Statistics only** mode (the default value is 30 days).

When the retention period for events elapses, information about the logged events is deleted and is not reflected in the report file. Before running the Applications Launch Control task in **Statistics only** mode, make sure that the task run time does not exceed the configured period for the specified events.

4. When the task has finished, export the logged events to a TXT file:
  - a. In the workspace of the **Administration Server** node in Kaspersky Security Center, select the **Events** tab.
  - b. Click the **Create a selection** button to create a selection of events based on the Blocked criterion to view the applications whose start will be blocked by the Applications Launch Control task.
  - c. In the results pane of the selection, click **Export events to file** to save the blocked application starts report to a TXT file.

Before importing and applying the generated report in a policy, make sure that the report only contains data on the applications whose start you want to allow.

5. Import data on blocked application starts into the Applications Launch Control task. To do so, in the policy properties in the Applications Launch Control task settings:

- a. On the **General** tab, click the **Rules list** button.  
The **Applications Launch Control rules** window opens.
- b. Click the **Add** button and, in the button's context menu, select **Import data of blocked applications from Kaspersky Security Center report**.
- c. Select the principle for adding rules from the list created based on a Kaspersky Security Center report to the list of previously configured Applications Launch Control rules:
  - **Add to existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are duplicated.
  - **Replace existing rules** if you want to replace the existing rules with the imported rules.
  - **Merge with existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.
- d. In the standard Microsoft Windows window that opens, select the TXT file to which events from the blocked application launch report have been exported.
- e. Click **Save** in the **Applications Launch Control rules** window.

Rules created based on the Kaspersky Security Center report on blocked applications are added to the list of Applications Launch Control rules.

## Importing Applications Launch Control rules from an XML file

You can import reports generated by the Rule Generator for Applications Launch Control group task and apply them as a list of allowing rules in the policy you are configuring.

When the Rule Generator for Applications Launch Control group task finishes, the application exports the created allowing rules into XML files saved in the specified shared folder. Each file with a rule list is created by analyzing files executed and applications launched on each separate protected device on the corporate network. The lists contain allowing rules for files and applications whose type matches the type specified in the Rule Generator for Applications Launch Control group task.

*To specify Applications Launch Control allowing rules for a group of protected devices based on an automatically generated list of allowing rules:*

1. On the **Tasks** tab in the detail pane of the group of protected devices you are configuring, create a [Rule Generator for Applications Launch Control group task or select an existing task](#).
2. In the properties of the created Rule Generator for Applications Launch Control group task or in the task wizard, specify the following settings:
  - In the **Notification** section, configure the settings for saving the task execution report.

For detailed instructions on configuring settings in this section, see the *Kaspersky Security Center Help*.

- In the **Settings** section, specify the types of applications whose start will be allowed by the rules that are created. You can edit the set of folders containing allowed applications: exclude default folders from the task scope or add new folders manually.

- In the **Options** section, specify the operations to be performed by the task while it is running and after it is finished. Specify the rule-generating criterion and the name of the file to which the generated rules will be exported.
- In the **Schedule** section, configure the task start schedule settings.
- In the **Account** section, specify the user account under which the task will be executed.
- In the **Exclusions from task scope** section, specify the groups of protected devices to be excluded from the task scope.

Kaspersky Embedded Systems Security does not create allowing rules for applications launched on excluded protected devices.

3. On the **Tasks** tab on the detail pane of the group of protected devices being configured, in the list of group tasks select the Rule Generator for Applications Launch Control task that you have created, and click the **Start** button to start the task.

When the task is finished, the automatically generated lists of allowing rules are saved in XML files in a shared folder.

Before using the Applications Launch Control task in the network, make sure that all protected devices have access to a shared folder. If the organization's policy does not provide for the use of a shared folder in the network, we recommend that you start the Rule Generator for Applications Launch Control task on a protected device in the test protected devices group or on a reference machine.

4. To add the generated lists of allowing rules to the Applications Launch Control task:
  - a. Open the [Applications Launch Control rules window](#).
  - b. Click the **Add** button and in the list that opens select **Import rules from XML file**.
  - c. Select the principle for adding the automatically generated allowing rules to the list of previously created Applications Launch Control rules:
    - **Add to existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are duplicated.
    - **Replace existing rules** if you want to replace the existing rules with the imported rules.
    - **Merge with existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.
  - d. In the standard Microsoft Windows window that opens, select XML files created after completion of the Rule Generator for Applications Launch Control group task.
  - e. Click **Save** in the **Applications Launch Control rules** window.
5. If you want to apply the created rules to control the launch of application, in the policy in the properties of the Applications Launch Control task, select the **Active** mode for the task.

Allowing rules automatically generated based on task runs on each separate protected device are applied to all network protected devices covered by the policy being configured. On these protected devices, the application will allow the launch of only those applications for which allowing rules have been created.

## Checking application launches

Before applying the configured Applications Launch Control rules, you can test any application to determine which Applications Launch Control rules are triggered by that application.

By default, Kaspersky Embedded Systems Security denies the launch of applications whose launch is not allowed by a single rule. To avoid the denial of the launch of important applications, you need to create allowing rules for them.

If the launch of an application is controlled by several rules of different types, denying rules are given priority: the launch of an application will be denied if it falls under even one denying rule.

*To test Applications Launch Control rules:*

1. [Open the Applications Launch Control rules window.](#)
2. In the window that opens, click the **Show rules for the file** button.  
The standard Microsoft Windows window opens.
3. Select the file whose start control you want to test.

The path to the specified file is displayed in the search field. The list contains all rules that will be triggered when the selected file is started.

## Creating a Rule Generator for Applications Launch Control task

*To create and configure the Rule Generator for Applications Launch Control task settings:*

1. [Open the Settings window in the New Task Wizard.](#)
2. Configure the following:
  - Specify [Prefix for rule names](#).
  - [Configure the allowing-rules usage scope.](#)
3. Click **Next**.
4. Specify the actions that must be performed by Kaspersky Embedded Systems Security:
  - [When generating allowing rules.](#)
  - [Upon task completion.](#)
5. In the **Schedule** window, set the scheduled task start settings.
6. Click **Next**.
7. In the **Selecting an account to run the task** window, specify the account you want to use.
8. Click **Next**.

9. Specify a task name.

10. Click **Next**.

The task name should be no longer than 100 characters and cannot contain the following symbols: " \* < > & \ : |

The **Finish creating the task** window opens.

11. You can optionally run the task after the Wizard finishes by selecting the **Run task after Wizard finishes** check box.

12. Click **Finish** to finish creating the task.

*To configure an existing rule in Kaspersky Security Center,*

open the **Properties: Rule Generator for Applications Launch Control** window and adjust the settings described above.

Information about the date and time when the settings were modified, and the values of task settings before and after modification, are saved in the system audit log.

## Restricting the task usage scope

*To restrict the scope of the Rule Generator for Applications Launch Control task:*

1. [Open the Properties: Rule Generator for Applications Launch Control window.](#)
2. Select how to create allowing rules:
  - [Create allowing rules based on running applications ?](#)
  - [Create allowing rules for applications from the folders ?](#)
3. Click **OK**.

The specified settings are saved.

## Actions to perform during automatic rule generation

*To configure the actions that Kaspersky Embedded Systems Security while the Rule Generator for Applications Launch Control task is running:*

1. Open the [Properties: Rule Generator for Applications Launch Control](#) window.
2. Open the **Options** tab.
3. In the **While generating allowing rules** section, configure the following settings:

- [Use digital certificate](#)
- [Use digital certificate subject and thumbprint](#)
- [If the certificate is missing, use](#)
  - **SHA256 hash.** The checksum of the file used to generate the rule is set as a criterion for triggering the allowing rule for Applications Launch Control. The application will allow start of programs launched using files with the specified checksum.
  - **path to file.** The path to the file used to generate the rule is set as a criterion for triggering the allowing rule for Applications Launch Control. The application will now allow start of programs launched using files located in the folders specified in the **Create allowing rules for applications from the folders** table in the **Settings** section.
- [Use SHA256 hash](#)
- [Generate rules for user or group of users](#)

4. Click **OK**.

The specified settings are saved.

## Actions to perform upon completion of automatic rule generation

*To configure the actions to be taken by Kaspersky Embedded Systems Security after the Rule Generator for Applications Launch Control task is finished:*

1. [Open the Properties: Rule Generator for Applications Launch Control window.](#)
2. Open the **Options** tab.
3. In the **After task completes** section, configure the following settings:
  - [Add allowing rules to the list of Applications Launch Control rules](#)
  - [Principle of adding](#)
  - **Export allowing rules to file.**
  - [Add protected device details to file name](#)

4. Click **OK**.

The specified settings are saved.

## Managing Applications Launch Control via the Application Console

In this section, you will learn how to navigate the Application Console interface and configure task settings on a protected device.

## Navigation

Learn how to navigate to the required task settings via the chosen interface.

### Opening the Applications Launch Control task settings

*To open the Applications Launch Control general task settings via the Application Console:*

1. In the Application Console tree, expand the **Computer Control** node.
2. Select the **Applications Launch Control** child node.
3. In the details pane of the **Applications Launch Control** child node, click the **Properties** link.  
The **Task settings** window opens.

### Opening the Applications Launch Control rules window

*To open the Applications Launch Control rule list via the Application Console:*

1. In the Application Console tree, expand the **Computer Control** node.
2. Select the **Applications Launch Control** child node.
3. In the results pane of the **Applications Launch Control** node, click the **Applications Launch Control rules** link.  
The **Applications Launch Control rules** window opens.
4. Configure the rules list as required.

### Opening the Rule Generator for Applications Launch Control task settings

*To configure the Rule Generator for Applications Launch Control task:*

1. In the Application Console tree, expand the **Automated rule generators** node.
2. Select the **Rule Generator for Applications Launch Control** child node.
3. In the results pane of the **Rule Generator for Applications Launch Control** child node, click the **Properties** link.  
The **Task settings** window opens.
4. Configure the task as required.

## Configuring Applications Launch Control task settings

To configure general Applications Launch Control task settings:

1. [Open the Task settings window.](#)
2. Configure the following task settings:
  - On the **General** tab:
    - [Applications Launch Control task mode.](#)
    - [Rule usage scope in the task.](#)
    - [KSN Usage.](#)
  - [Software Distribution Control settings](#) on the **Software Distribution Control** tab.
  - [Task start schedule settings](#) on the **Schedule** and **Advanced** tabs.
3. Click **OK** in the **Task settings** window.  
The modified settings are saved.

Kaspersky Embedded Systems Security immediately applies the new settings to the running task. Information about the date and time when the settings were modified, and the values of task settings before and after modification, are saved in the system audit log.

## Selecting the mode of the Applications Launch Control task

To configure the mode of the Applications Launch Control task:

1. Open the [Task settings](#) window.
2. On the **General** tab, in the [Task mode](#) drop-down list, specify the task mode.
3. Clear or select the [Repeat action taken for the first file launch on all the subsequent launches for this file](#) check box.

Kaspersky Embedded Systems Security creates a new list of cached events every time the Applications Launch Control task settings are modified. This means that Applications Launch Control is performed according to the current security settings.

4. Clear or select the [Deny the command interpreters launch with no command to execute](#) check box.
5. Click **OK** in the **Task settings** window.

The specified settings are saved.

All attempts to start applications are recorded in the task log.

## Configuring the scope of the Applications Launch Control task

To define the scope of the Applications Launch Control task:

1. Open the [Task settings](#) window.
2. On the **General** tab, in the **Rule usage scope** section, specify the following settings:
  - [Apply rules to executable files](#)
  - [Monitor loading of DLL modules](#)

Controlling loading of DLL modules may affect the performance of the operating system.

- [Apply rules to scripts and MSI packages](#)

3. Click **OK** in the **Task settings** window.

The specified settings are saved.

## Configuring KSN usage

To configure the use of KSN services for the Applications Launch Control task:

1. Open the [Task settings](#) window.
2. On the **General** tab, in the **KSN Usage** section, specify the settings for use of KSN services:
  - If necessary, select the [Deny applications untrusted by KSN](#) check box.
  - If necessary, select the [Allow applications trusted by KSN](#) check box.
  - If the **Allow applications trusted by KSN** check box is selected, indicate the users and/or groups of users allowed to start applications trusted in KSN. To do this, perform the following actions:
    - a. Click the **Edit** button.

The standard Microsoft Windows **Select users or groups** window opens.

By default, access to programs trusted in KSN is allowed to all users.

- b. Specify the list of users and/or user groups.
- c. Click **OK**.

3. Click **OK** in the **Task settings** window.

The specified settings are saved.

# Software Distribution Control

To add a trusted distribution package:

1. Open the [Task settings](#) window.
2. On the **Software Distribution Control** tab, select the [Automatically allow software distribution via applications and packages listed](#) check box.

You can select the **Automatically allow software distribution via applications and packages listed**, if the **Apply rules to executable files** check box in the **General** tab is selected in the **Applications Launch Control** task settings.

3. Clear the [Always allow software distribution via Windows Installer](#) check box if required.

Clearing the **Always allow software distribution via Windows Installer** check box is only recommended if it is absolutely necessary. Turning off this function may cause issues with updating operating system files and also prevent the launch of files extracted from a distribution package.

4. If required, select the [Always allow software distribution via SCCM using the Background Intelligent Transfer Service](#) check box.

The application controls the software distribution cycle on the protected device — from package delivery to installation or update. The application does not control processes if any stage of distribution was performed before installation of the application on the protected device.

5. To create the allow list or to edit the existing list of trusted distribution packages, click **Change packages list** and select one of the following methods in the window that appears:

- **Add one distribution package.**
  - a. Click the **Browse** button.
  - b. Select the executable file or distribution package.

The **Trusting criteria** section is automatically populated with data about the selected file.
  - c. Clear or select the **Allow the further distribution of programs created from this distribution package** check box.
  - d. Select one of two available options for criteria to use to determine whether a file or distribution package is trusted:
    - **Use digital certificate**
    - **Use SHA256 hash**
- **Add several packages by hash.**

You can select an unlimited number of executable files and distribution packages, and add them to the list all at the same time. Kaspersky Embedded Systems Security examines the hash and allows the operating system to launch the specified files.

- **Change selected package.**

Use this option to select a different executable file or distribution package, or to change the trust criteria.

- **[Import distribution packages list from file](#)**.

In the **Open** window, specify the configuration file containing a list of trusted distribution packages.

6. If you want to remove a previously added application or distribution package for the trusted list, click the **Delete distribution packages** button. Extracted files will be allowed to run.

To prevent extracted files from starting, uninstall the application on the protected device or create a denying rule in the Applications Launch Control task settings.

7. Click **OK**.

Your newly configured settings are saved.

## Configuring Applications Launch Control rules

Learn how to generate, import and export a list of rules, or manually create allowing or denying rules using the Application Launch Control task.

## Adding an Applications Launch Control rule

*To add an Applications Launch Control rule:*

1. **[Open the Applications Launch Control rules window](#)**.
2. Click the **Add** button.
3. In the context menu of the button, select **Add one rule**.  
The **Rule settings** window opens.
4. Specify the following settings:
  - a. In the **Name** field, enter the name of the rule.
  - b. In the **Type** drop-down list, select the rule type:
    - **Allowing** if you want the rule to allow launch of applications in accordance with the criteria specified in the rule settings.
    - **Denying** if you want the rule to block launch of applications in accordance with the criteria specified in the rule settings.

c. In the **Scope** drop-down list, select the type of files whose execution will be controlled by the rule:

- **Executable files** if you want the rule to control launch of executable files.
- **Scripts and MSI packages** if you want the rule to control launch of scripts and MSI packages.

d. In the **User or user group** field, specify the users who will be allowed or not allowed to start programs based on the type of rule. To do this, perform the following actions:

1. Click the **Browse** button.
2. The standard Microsoft Windows **Select user or groups** window opens.
3. Specify the list of users and/or user groups.
4. Click **OK**.

e. If you want to take the values of the rule-triggering criteria listed in the **Rule triggering criterion** section from a specific file:

1. Click the **Set rule triggering criterion from file properties** button.

The standard Microsoft Windows **Open** window opens.

2. Select the file.

3. Click the **Open** button.

The criteria values in the file are displayed in the fields in the **Rule triggering criterion** group box. The criterion for which data are available in the file properties is selected by default.

f. In the **Rule triggering criterion** group box, select one or several of the following options as applicable:

- **Digital certificate** if you want the rule to control the start of applications launched using files signed with a digital certificate:
  - Select the **Use subject** check box if you want the rule to control the launch of files signed with a digital certificate only with the specified header.
  - Select the **Use thumb** check box if you want the rule to only control the launch of files signed with a digital certificate with the specified thumbprint.
- **SHA256 hash** if you want the rule to control the start of programs launched using files whose checksum matches the one specified.
- **Path to file** if you want the rule to control the start of programs launched using files located at the specified path.
  - **Command line** if you want the rule to control the start of programs launched using the arguments specified in the command line field. The field is enabled after you select the **Path to file** option. You can use ? and \* characters as a mask when specifying the command line arguments for launched processes as a criterion.

Kaspersky Embedded Systems Security does not recognize paths that contain slashes ("/"). Use backslash ("\") to enter the path correctly.

When specifying the objects, you can use ? and \* characters as file masks.

You should select at least one option. Otherwise, the Application Launch Control rule is not added.

g. If you want to add rule exclusions:

1. In the **Exclusions from rule** section, click the **Add** button.

The **Exclusion from rule** window opens.

2. In the **Name** field, enter the name of the exclusion.

3. Specify the settings for exclusion of application files from the Applications Launch Control rule. You can fill out the settings fields from the file properties by clicking the **Set exclusion based on file properties** button.

- [Digital certificate](#)
- [Use subject](#)
- [Use thumb](#)
- [SHA256 hash](#)
- [Path to file](#)

4. Click **OK**.

5. If necessary, repeat steps (i)–(iv) to add additional exclusions.

5. Click **OK** in the **Rule settings** window.

The created rule is displayed in the list in the **Applications Launch Control rules** window.

## Enabling the Default Allow mode

Default Allow mode allows all applications to start if they are not blocked by rules or by a conclusion from KSN that they are not trusted. Default Allow mode can be enabled by adding specific allowing rules. You can enable Default Allow for only scripts or for all executable files.

*To add a Default Allow rule:*

1. Open the **Applications Launch Control rules** window.

2. Click the **Add** button.

3. In the context menu of the button, select **Add one rule**.

The **Rule settings** window opens.

4. In the **Name** field, enter the name of the rule.

5. In the **Type** drop-down list, select the **Allowing** rule type.

6. In the **Scope** drop-down list, select the type of files whose execution will be controlled by the rule:

- **Executable files** if you want the rule to control the launch of executable files.
- **Scripts and MSI packages** if you want the rule to control the launch of scripts and MSI packages.

7. In the **Rule triggering criterion** group box, select the **Path to file** option.

8. Enter the following mask: `? : \`

9. Click **OK** in the **Rule settings** window.

Kaspersky Embedded Systems Security applies the Default Allow mode.

## Creating allowing rules from Applications Launch Control task events

*To create a configuration file that contains allowing rules generated from Applications Launch Control task events:*

1. Start the Applications Launch Control task in **Statistics only mode** to record information about all applications launches on a protected device in the task log.
2. After the task finishes running in **Statistics only** mode, open the task log by clicking the **Open task log** button in the **Management** section of the **Applications Launch Control** node's detail pane.
3. In the **Logs** window, click **Generate rules based on events**.

Kaspersky Embedded Systems Security will generate an XML configuration file containing a rule list based on events of the Applications Launch Control task in **Statistics only** mode. You can [apply this rule list](#) in the Applications Launch Control task.

Before applying the rule list generated from the logged task events, we recommend that you review and manually process the list to be certain that the launch of critical files (for example, system files) is allowed by the specified rules.

All task events are recorded in the task log regardless of the task mode. You can generate a configuration file with a rule list based on the log created while the task is running in **Active** mode. This scenario is not recommended except for urgent cases, because a final rule list must be generated before the task is run in **Active** mode in order to make it efficient.

## Exporting Applications Launch Control rules

*To export Applications Launch Control rules to a configuration file:*

1. Open the **Applications Launch Control rules** window.
2. Click the **Export to a file** button.

The standard Microsoft Windows window opens.

3. In the window that opens, specify the file to which you want to export the rules. If no such file exists, it will be created. If a file with the specified name already exists, its contents will be overwritten when the rules are exported.

4. Click the **Save** button.

The rule settings will be exported to the specified file.

## Importing Applications Launch Control rules from an XML file

*To import Applications Launch Control rules:*

1. Open the **Applications Launch Control rules** window.
2. Click the **Add** button.
3. In the context menu of the button, select **Import rules from XML file**.
4. Specify the method for adding the imported rules. To do so, select one of the options from the context menu of the **Import rules from XML file** button:
  - **Add to existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are duplicated.
  - **Replace existing rules** if you want to replace the existing rules with the imported rules.
  - **Merge with existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.

The standard Microsoft Windows **Open** window opens.

5. In the **Open** window, select the XML file that contains the Applications Launch Control rules.
6. Click the **Open** button.

The imported rules will be displayed in the list in the **Applications Launch Control rules** window.

## Removing Applications Launch Control rules

*To remove Applications Launch Control rules:*

1. Open the **Applications Launch Control rules** window.
2. In the list, select one or more rules that you want to delete.
3. Click the **Remove Selected** button.
4. Click the **Save** button.

The selected Applications Launch Control rules are deleted.

## Configuring a Rule Generator for Applications Launch Control task

*To configure the Rule Generator for Applications Launch Control task settings:*

1. Open the [Task settings](#) window of the **Rule Generator for Applications Launch Control** task.
2. Configure the following settings:
  - On the **General** tab:
    - Specify [Prefix for rule names](#).
    - [Configure the allowing-rules usage scope](#).
  - On the **Actions** tab, [specify the actions that must be performed by Kaspersky Embedded Systems Security](#).
  - On the **Schedule** and **Advanced** tabs, [configure Schedule task start settings](#).
  - On the **Run as** tab, [configure Task start settings with account permission](#).
3. Click **OK** in the **Task settings** window.

Kaspersky Embedded Systems Security immediately applies the new settings to the running task. Information about the date and time when the settings were modified, and the values of task settings before and after modification.

## Restricting the task usage scope

*To restrict the scope of the Rule Generator for Applications Launch Control task:*

1. Open the [Task settings](#) window of the **Rule Generator for Applications Launch Control** task.
2. Select how to create allowing rules:
  - [Create allowing rules based on running applications](#).
  - [Create allowing rules for applications from the folders](#).
3. Click **OK** in the **Task settings** window.

The specified settings are saved.

## Actions to perform during automatic rule generation

*To configure the actions of Kaspersky Embedded Systems Security during the running and upon the completion of the Rule Generator for Applications Launch Control task:*

1. Open the [Task settings](#) window of the **Rule Generator for Applications Launch Control** task.
2. Open the **Options** tab.
3. In the **While generating allowing rules** section, configure the following settings:
  - [Use digital certificate](#)

- [Use digital certificate subject and thumbprint](#)
- [If the certificate is missing, use](#)
  - **SHA256 hash.** The checksum of the file used to generate the rule is set as a criterion for triggering the allowing rule for Applications Launch Control. The application will allow start of programs launched using files with the specified checksum.
  - **path to file.** The path to the file used to generate the rule is set as a criterion for triggering the allowing rule for Applications Launch Control. The application will now allow start of programs launched using files located in the folders specified in the **Create allowing rules for applications from the folders** table in the **Settings** section.
- [Use SHA256 hash](#)
- [Generate rules for user or group of users](#)

4. In the **After task completes** section, configure the following settings:

- [Add allowing rules to the list of Applications Launch Control rules](#)
- [Principle of adding](#)
- Export allowing rules to file.
- [Add protected device details to file name](#)

5. Click **OK** in the **Task settings** window.

The specified settings are saved.

## Actions to perform upon completion of automatic rule generation

*To configure the actions to be taken by Kaspersky Embedded Systems Security after the Rule Generator for Applications Launch Control task is finished:*

1. Open the [Task settings](#) window of the **Rule Generator for Applications Launch Control** task.
2. Open the **Options** tab.
3. In the **After task completes** section, configure the following settings:
  - [Add allowing rules to the list of Applications Launch Control rules](#)
  - [Principle of adding](#)
  - Export allowing rules to file.
  - [Add protected device details to file name](#)
4. Click **OK** in the **Task settings** window.

The specified settings are saved.

# Managing Applications Launch Control via the Web Plug-in

To configure Applications Launch Control tasks via the Web Plug-in:

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the <Policy name> window that opens select the **Application settings** tab.
4. Select the **Local activity control** section.
5. Click **Settings** in the **Applications Launch Control** subsection.
6. Configure the settings described in the table below.

Applications Launch Control task settings

Setting	Description
<b>Task mode</b>	<p>In this drop-down list, you can select the Applications Launch Control task's mode:</p> <ul style="list-style-type: none"><li>• <b>Active.</b> Kaspersky Embedded Systems Security uses the specified rules to control the launch of any application.</li><li>• <b>Statistics only.</b> Kaspersky Embedded Systems Security does not use the specified rules to control application launches. Instead, it simply records information about launch events in the task log. All applications are allowed to start. You can use this mode to generate a list of Applications Launch Control rules based on the information about denied application launches recorded in the task log.</li></ul> <p>By default, the Applications Launch Control task runs in <b>Statistics only</b> mode.</p>
<b>Repeat action taken for the first file launch on all the subsequent launches for this file</b>	<p>The check box enables or disables launch control for the second and subsequent attempts to start applications based on the event information stored in the cache.</p> <p>If the check box is selected, Kaspersky Embedded Systems Security allows or denies subsequent launches of an application based on the task's conclusion regarding the first launch of the application. For example, if the first application launch was allowed by the rules, information about this decision will be stored in the cache, and the second and all subsequent launches will also be allowed without rechecking.</p> <p>If the check box is cleared, Kaspersky Embedded Systems Security analyzes an application every time a launch is attempted.</p> <p>The check box is cleared by default.</p>
<b>Deny the command interpreters launch with no command to execute</b>	<p>If the check box is selected, Kaspersky Embedded Systems Security denies the launch of command line interpreters even if launching interpreters is allowed. A command interpreter can only be launched with no command if both of the following conditions are met:</p> <ul style="list-style-type: none"><li>• Launch of the command line interpreter is allowed.</li><li>• The command to be executed is allowed.</li></ul>

	<p>If the check box is cleared, Kaspersky Embedded Systems Security only considers allowing rules when launching a command line interpreter. The launch is denied if no allowing rule applies or the executable process is not trusted by KSN. If an allowing rule applies or the process is trusted by KSN, a command line interpreter can be launched with or without a command to execute.</p> <p>Kaspersky Embedded Systems Security recognizes the following command line interpreters:</p> <ul style="list-style-type: none"> <li>• cmd.exe</li> <li>• powershell.exe</li> <li>• python.exe</li> <li>• perl.exe</li> </ul> <p>The check box is cleared by default.</p>
<p><b>Apply rules to executable files</b></p>	<p>The check box either enables or disables launch control of executable files.</p> <p>If this check box is selected, Kaspersky Embedded Systems Security allows or blocks start of executable files using the specified rules whose settings specify <b>Executable files</b> as the scope.</p> <p>If the check box is cleared, Kaspersky Embedded Systems Security does not control start of executable files using the specified rules. Startup of executable files is allowed.</p> <p>The check box is selected by default.</p>
<p><b>Monitor loading of DLL modules</b></p>	<p>The check box either enables or disables control of loading of DLL modules.</p> <p>If this check box is selected, Kaspersky Embedded Systems Security allows or blocks loading of DLL modules using the specified rules whose settings specify <b>Executable files</b> as the scope.</p> <p>If this check box is cleared, Kaspersky Embedded Systems Security does not control loading of DLL modules using the specified rules. Loading of DLL modules is allowed.</p> <p>The check box is active if the <b>Apply rules to executable files</b> check box is selected.</p> <p>The check box is selected by default.</p>
<p><b>Apply rules to scripts and MSI packages</b></p>	<p>The check box either enables or disables launch of scripts and MSI packages.</p> <p>If this check box is selected, Kaspersky Embedded Systems Security allows or blocks start of scripts and MSI packages using the specified rules whose settings specify <b>Scripts and MSI packages</b> as the scope.</p> <p>If the check box is cleared, Kaspersky Embedded Systems Security does not control start of scripts and MSI packages using specified rules. Start of scripts and MSI packages is allowed.</p> <p>The check box is selected by default.</p>
<p><b>Deny applications untrusted by KSN</b></p>	<p>The check box either enables or disables Applications Launch Control according to application reputation data in KSN.</p> <p>If this check box is selected, Kaspersky Embedded Systems Security blocks any application from running if it is not trusted in KSN. Applications Launch Control allowing rules that apply to applications not trusted in KSN will not be triggered. Selecting the check box provides additional protection from malware.</p> <p>If the check box is cleared, Kaspersky Embedded Systems Security does not consider the reputation of applications not trusted in KSN and allows or blocks start in accordance with the rules that apply to such applications.</p>

	The check box is cleared by default.
<b>Allow applications trusted by KSN</b>	<p>The check box either enables or disables Applications Launch Control according to application reputation data in KSN.</p> <p>If this check box is selected, Kaspersky Embedded Systems Security allows applications to run if they are trusted in KSN. Denying application launch control rules that apply to KSN-trusted applications have higher priority: if an application is trusted by KSN services, the application launch will be denied.</p> <p>If the check box is cleared, Kaspersky Embedded Systems Security does not consider the reputation of KSN-trusted applications and allows or denies launch in accordance with rules that apply to such applications.</p> <p>The check box is cleared by default.</p>
<b>Users and / or user groups allowed to run applications trusted by KSN</b>	<p>If the <b>Allow applications trusted by KSN</b> check box is selected, here you can specify users and user groups allowed to start applications that are trusted by KSN.</p> <p>By default, the following users are specified: <b>Everyone</b> and <b>NT AUTHORITY\SYSTEM</b>.</p>
<b>Rules</b>	<a href="#">Configure allowing or denying rules</a> for the Application Launch Control task.
<b>Software Distribution Control</b>	You can <a href="#">add trusted distribution packages</a> .
<b>Task management</b>	You can configure settings to start the task on a schedule.

# Device Control

This section contains information about the Device Control task and how to configure it.

## About Device Control task

Kaspersky Embedded Systems Security controls registration and usage of the external devices and CD/DVD drives in order to protect a device against computer security threats, that may occur in process of file exchange with flash drives or other type of external device connected via USB.

Kaspersky Embedded Systems Security controls the following USB external devices connections:

- USB-connected flash drives
- CD/DVD ROM drives
- USB-connected floppy disk drives
- USB-connected network adapters
- USB-connected MTP-mobile devices

Kaspersky Embedded Systems Security informs you about all devices connected via USB with the corresponding event in the task and event logs. The event details include device type and connection path. When the Device Control task is started, Kaspersky Embedded Systems Security checks and lists all devices connected via USB. You can configure the notifications in the Kaspersky Security Center notification settings section.

The Device Control task monitors all the attempts of external devices connections to a protected device via USB and blocks connection, if there are no allowing rules for such devices. After the connection is blocked, the device is not available.

The application prescribes one of the following statuses to each connected external device:

- *Trusted*. Device for which you want to allow files exchange. Upon rules list generation, the *Device instance path* value is included into usage scope for at least one rule.
- *Untrusted*. Device for which you want to restrict files exchange. Device instance path is not included into any allowing rule usage scope.

You can create allowing rules for external devices to allow data exchange using the Rule Generator for Device Control task. You can also expand the usage scope for already specified rules. You cannot create allowing rules manually.

Kaspersky Embedded Systems Security identifies external devices that are registered in the system, by using the Device Instance Path value. Device Instance Path is a default feature uniquely specified for each external device. The Device Instance Path value is specified for each external device in its Windows properties and is automatically determined by Kaspersky Embedded Systems Security during rule generation.

The Device Control task can operate in two modes:

- **Active.** Kaspersky Embedded Systems Security applies rules to control the connection of flash drives and other external devices, and allows or blocks the use of all devices according to the Default Deny principle and specified allowing rules. The use of trusted external devices is allowed. The use of untrusted external devices is blocked by default.

If an external device you consider to be untrusted is connected to a protected device before the Device Control task is run in the **Active** mode, the device is not blocked by the application. We recommend that you disconnect the untrusted device manually or restart the protected device. Otherwise, the Default Deny principle will not be applied to the device.

- **Statistics only.** Kaspersky Embedded Systems Security does not control the connection of flash drives and other external devices, but only logs information about the connection and registration of external devices on a protected device, and about the Device Control allowing rules triggered by the connected devices. The use of all external devices is allowed. This mode is set by default.

You can apply this mode for rules generation on the basis of the information about blocking devices logged during the [task running](#).

## About Device Control rules

Kaspersky Embedded Systems Security does not apply allowing rules for MTP-connected mobile devices.

The rules are generated uniquely for each device that is currently connected or has ever been connected to a protected device if the information about this device is stored in the system registry.

To generate allowing rules for device control:

- [Apply the Rule Generator for Device Control task.](#)
- [Run the Device Control task in the Statistics only mode.](#)
- [Apply system information about previously connected devices.](#)
- [Expand the usage scope for already specified rules.](#)

The maximum number of the Device Control rules supported by Kaspersky Embedded Systems Security is 3072.

Device Control rules are described below.

### Rule type

Rule type is always *allowing*. By default, the Device Control task blocks all flash drives and other external devices connections if these devices are not included into any allowing rule usage scope.

### Triggering criterion and rule usage scope

Device Control rules identify flash drives and other external devices basing on *Device instance path*. Device instance path is a unique criterion that is assigned to a device by the system when the device is connected and is registered as an External Device or CD/DVD drive (for example, IDE or SCSI).

Kaspersky Embedded Systems Security controls connection of the CD/DVD drives regardless of the bus used for connection. When mounting such device via USB, operating system registers two path values to the device instance: for the external device and for CD/DVD drive (for example, IDE or SCSI). To connect such devices correctly, allowing rules for each path value to the instance must be set.

Kaspersky Embedded Systems Security automatically defines the device instance path and parses the value obtained into the following elements:

- Device manufacturer (VID)
- Device controller type (PID)
- Device serial number

You cannot set the device instance path manually. Allowing rule triggering criteria define the rule usage scope. By default, newly created rule usage scope includes one initial device, basing on whose properties Kaspersky Embedded Systems Security had generated the rule. You can configure the values in the created rule settings by using a mask to expand the [rule usage scope](#).

## Initial device values

Device properties that Kaspersky Embedded Systems Security used for allowing rule generation and that are displayed in Windows Device Manager for each device connected.

Initial device values contain the following information:

- **Device instance path.** Basing on this property Kaspersky Embedded Systems Security defines rule triggering criteria and fills the following fields: **Manufacturer (VID)**, **Controller type (PID)**, **Serial number** in the **Rule usage scope** section of the **Rule properties** window.
- **Friendly name.** Device clear name that is set in the device properties by its manufacturer.

Kaspersky Embedded Systems Security automatically defines initial device values when the rule is generating. Later on you can use these values to recognize the device that was used as a base for the rule generating. Initial device values are not available for editing.

## Description

You can add additional information for each created device control rule in the **User or group of users** field, for example, you can note name of the connected flash driver or define its owner. The description is displayed in a corresponding graph in the **Device Control rules** window.

Description and initial device values are not allowed for rule triggering and are prescribed only to simplify device identification by user.

## About Device Control rules generation

You can import device control allowing rules from the XML files that were automatically generated during the Device Control or the Rule Generator for Device Control tasks running.

By default, Kaspersky Embedded Systems Security restricts connections of any flash drives and other external devices, if they are not included into the usage scope of specified device control rules.

Targets and scenarios for device control rules generation

Rule generation scenario	Target
The Rule Generator for Device Control task	<ul style="list-style-type: none"><li>• Add allowing rules for previously connected trusted devices before the first start of the Device Control task.</li><li>• Generate rules list for devices trusted in the protected devices network.</li></ul>
Rules generation based on system data	Add allowing rules for one or several external devices, whose data have been stored in the system.
Rules generation based on data about the currently connected devices	Renew an already specified rules list when it is necessary to trust a little amount of new external devices.
The Device Control task in the <b>Statistics only</b> mode	Generate allowing rules for a large number of trusted devices.

### The Rule Generator for Device Control task usage

XML file, generated upon the Rule Generator for Device Control task completion, contains allowing rules for those flash drives and other external devices whose data have been stored in a system registry.

Use this scenario during the rule generation process to take into account all ever connected external devices that are registered by the systems on all network protected device or to consider only data about devices currently connected to all network protected device. The task also allows for all external devices that a connected at the moment of task running. Upon the group task completion Kaspersky Embedded Systems Security generates allowing rules lists for all external devices registered in the network and saves these lists in an XML file in a specified folder. Then you can manually import generated rules in the Device Control task settings. Unlike a task on a protected device, the policy does not allow configuring the automatic addition of the created rules to the list of Device Control rules when the Rule Generator for Device Control group task is completed.

This scenario is recommended to generate allowing rules list before the first start of the Device Control task, so that allowing rules generated cover all trusted external devices that are used on a protected device.

### Usage of system data about all connected devices

During the task running, Kaspersky Embedded Systems Security receives system data about all external devices that have ever been connected or that are currently connected to a protected device, and displays detected devices in the list of the **Generate rules based on the system information** window.

For each detected device Kaspersky Embedded Systems Security parses the values of manufacturer (VID), controller type (PID), friendly name, serial number and device instance path. You can generate allowing rules for any external device, whose data have been stored in the system, and straightly add newly created rules to the list of the device control rules.

According to this scenario Kaspersky Embedded Systems Security generates allowing rules for external devices that have ever been connected or are currently connected to a protected device with Kaspersky Security Center installed.

This scenario is recommended to renew an already specified rules list when it is necessary to trust a little amount of new external devices.

## Usage of data about the currently connected devices

In this scenario, Kaspersky Embedded Systems Security generates allowing rules only for currently connected external devices. You can select one or more external devices for which you want to generate allowing rules.

## Usage of the Device Control task in the Statistics only mode

XML file received upon the Device Control task completion in the **Statistics only** mode is generated basing on the task log.

During the task running Kaspersky Embedded Systems Security logs information about all connections of flash drives and other external devices to a protected device. You can generate allowing rules based on task events and export them to an XML file. Before starting the task in the **Statistics only** mode, it is recommended to configure the task running period so that during the term specified all the possible external devices connections to a protected device would be performed.

This scenario is recommended to renew an already generated rules list if it is required to allow a large number of new external devices.

If the rule list generation according to this scenario is performed on a template machine, you can apply a generated allowing rules list while configuring the Device Control task via the Kaspersky Security Center. This way you will be able to allow to use the external devices that are connected to a template machine on all the protected devices.

## About Rule Generator for Device Control task

The Rule Generator for Device Control task can automatically create a list of allowing rules for connected flash drives and other external devices basing on the system data about all external devices that have ever been connected to a protected device.

Upon the task completion Kaspersky Embedded Systems Security creates an XML configuration file that contains allowing rules list for all detected external devices or straightly adds generated rules in the Device Control task depending on the Rule Generator for Device Control settings. The application will subsequently allow devices for which allowing rules were automatically generated.

Generated and added in the task rules are displayed in the **Device Control rules** window.

## Device Control default task settings

By default, the Device Control task has the settings described in the table below. You can change the values of these settings.

Default Device Control task settings

Setting	Default value	Description
<b>Task mode</b>	<b>Statistics only</b>	The task logs information about external devices that were blocked or allowed according to the specified rules. External devices are not actually blocked.  You can select the <b>Active</b> mode for device protection to actually block the use of external devices.
<b>Allow using all external devices when the Device Control task is not running</b>	Not applied	Kaspersky Embedded Systems Security blocks use of external devices, regardless of the Device Control task state. This provides maximum protection level against computer security threats arising when exchanging files with external devices.  You can adjust the setting so that Kaspersky Embedded Systems Security allows use of all external devices when the Device Control task is not running.
Task start schedule	First run is not scheduled.	The Device Control task does not start automatically at the start of Kaspersky Embedded Systems Security.  You can configure the task start schedule.

Rule Generator for Device Control task default settings

Setting	Default value	Description
<b>Task mode</b>	<b>Consider system data about all external devices that have ever been connected</b>	The task operation mode.  You can select the <b>Consider currently connected external devices only</b> task mode.
Actions upon task completion	Allowing rules are added to the list of Device Control rules; new rules are merged with existing ones; duplicated rules are removed.	You can add rules to existing ones without merging them and without deleting duplicated rules, or replace existing rules with new allowing rules, or configure export of allowing rules to a file.
Task start schedule	First run is not scheduled.	The Rule Generator for Device Control task does not start automatically at startup of Kaspersky Embedded Systems Security. You can start the task manually or configure a scheduled start.

## Managing Device Control via the Administration Plug-in

In this section, learn how to navigate through the Administration Plug-in interface and manage connections of any external devices to all protected devices on the network by generating rule lists via the Kaspersky Security Center for the groups of protected devices.

### Navigation

Learn how to navigate to the required task settings via the chosen interface.

## Opening policy settings for the Device Control task

*To open the Device Control task settings via the Kaspersky Security Center policy:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Policies** tab.
4. Double-click the policy name you want to configure.
5. In the **Properties: <Policy name>** window that opens, select the **Local activity control** section.
6. Click the **Settings** button in the **Device Control** subsection.  
The **Device Control** window opens.
7. Configure the policy as required.

## Opening the Device Control rules list

*To open the Device Control rules list via the Kaspersky Security Center:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Policies** tab.
4. Double-click the policy name you want to configure.
5. In the **Properties: <Policy name>** window that opens, select the **Local activity control** section.
6. Click the **Settings** button in the **Device Control** subsection.  
The **Device Control** window opens.
7. On the **General** tab, click the **Rules list** button.  
The **Device Control rules** window opens.
8. Configure the policy as required.

## Opening the Rule Generator for Device Control task wizard and properties

*To initialize creation of a Rule Generator for Device Control task:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.

2. Select the administration group for which you want to configure the task.
3. Select the **Tasks** tab.
4. Click **Create a task** button.  
The **New Task Wizard** window opens.
5. Select the **Rule Generator for Device Control** task.
6. Click **Next**.  
The **Settings** window opens.

*To configure the existing Rule Generator for Device Control task:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Tasks** tab.
4. Double-click the task name in the list of Kaspersky Security Center tasks.  
The **Properties: Rule Generator for Device Control** window opens.

See the [Configuring the Rule Generator for Device Control task](#) section for details on configuring the task.

## Configuring Device Control task

*To configure the Device Control task settings:*

1. [Open the Device Control window](#).
2. On the **General** tab, configure the following task settings:
  - In the **Task mode** section, select one of the task modes:

- [Active](#) 

If an external device you consider to be untrusted is connected to a protected device before the Device Control task is run in the Active mode, the device is not blocked by the application. We recommend that you disconnect the untrusted device manually or restart the protected device. Otherwise, the Default Deny principle will not be applied to the device.

- [Statistics only](#) 
3. Click the **Rules list** button to edit the [list of Device control rules](#).
  4. If necessary, configure the scheduled task start settings on the **Task management** tab.
  5. Click **OK** in the **Device Control** window.

Kaspersky Embedded Systems Security immediately applies the new settings to the running task. Information about the date and time when the settings were modified, and the values of task settings before and after modification, are saved in the system audit log.

## Configuring the Rule Generator for Device Control task

To configure the Rule Generator for Device Control task:

1. Open the [Properties: Rule Generator for Device Control](#) window.
2. In the **Notification** section, configure the task event notification settings.

For detailed information regarding configuring settings in this section, see the *Kaspersky Security Center Help*.

3. In the **Settings** section, you can configure the following settings:
  - Select the operation mode: consider system data about all external devices that have ever been connected or consider currently connected external devices only.
  - Configure settings for configuration files with allowing rules lists that Kaspersky Embedded Systems Security creates upon the task completion.
4. Configure the task schedule in the **Schedule** section (you can configure a schedule for all task types except Rollback of Database Update).
5. In the **Account** section, specify the account whose rights will be used to run the task.
6. If required, specify the objects to exclude from the task scope in the **Exclusions from task scope** section.

For detailed information on configuring settings in these sections, see *Kaspersky Security Center Help*.

7. In the **Properties: <Task name>** window, click **OK**.  
The newly configured group task settings are saved.

## Configuring Device Control rules via the Kaspersky Security Center

Learn how to generate a list of rules based on various criteria or manually create allowing or denying rules using the Device Control task.

### Creating allowing rules based on system data in a Kaspersky Security Center policy

To specify allowing rules using the **Generate rules based on system data** option in the Device Control task:

1. If necessary, connect a new external device that you want to make trusted to a protected device with the Kaspersky Security Center Administration Console installed.
2. [Open the Device Control rules window.](#)
3. Click the **Add** button and in the context menu that opens select the **Generate rules based on system data** option.
4. In the device list of **Generate rules based on the system information** window, select a device.
5. Click **Add rules for the selected devices**.
6. Click the **Save** button in the **Device Control rules** window.

Rules list in the Device Control task will be filled up with new rules generated basing on a system data of the protected device with the Kaspersky Security Center Administration Console installed.

## Generating rules for connected devices

*To specify allowing rules using the **Generate rules based on connected devices** option in the Device Control task:*

1. Open the [Device Control rules](#) window.
2. Click the **Add** button and in the context menu, select **Generate rules based on connected devices**.  
The **Generate rules based on the system information** window opens.
3. In the list of detected devices connected to the protected device, select the devices you want to generate allowing rules for.
4. Click the **Add rules for the selected devices** button.
5. Click the **Save** button in the **Device Control rules** window.

Rules list in the Device Control task will be filled up with new rules generated basing on a system data of the protected device with the Kaspersky Security Center Administration Console installed.

## Generating rules based on Kaspersky Security Center registry

*To specify allowing rules using the **Generate rules based on connected devices** option in the Device Control task:*

1. Open the [Device Control rules](#) window.
2. Click the **Add** button and in the context menu, select **Generate rules based on connected devices**.  
The **Generate rules based on the system information** window opens.
3. Click **Refresh the list** to obtain the list of available devices and select the devices you want to generate allowing rules for. Also, you can specify the **Friendly name** in the **Search** field to filter the devices and speed up the selection.
4. Click the **Add rules for the selected devices** button.
5. Click the **Save** button in the **Device Control rules** window.

Rules list in the Device Control task will be filled up with new rules generated based on Kaspersky Security Center registry.

## Viewing properties of Device Control rules

To view the properties of the **Device Control** rules:

1. Open the **Device Control** window.
2. On the **General** tab, click the **Rules list** button and double-click the selected rule.

The **Rule properties** window appears.

Properties of Device Control rules

Property	Description
Apply rule	Use this option to enable or disable the rule application.
Manufacturer (VID)	<p>You can specify the full VID of the device manufacturer or use * as a mask. * stands for any manufacturer.</p> <p>If the Use mask check box is selected for the Manufacturer (VID) field, the data from the field with the selected check box is replaced with the * character and is not considered when the rule is applied.</p>
Controller type (PID)	<p>You can specify the full PID of the controller or use * as a mask. * stands for any type of the controller.</p> <p>If the Use mask check box is selected for the Controller type (PID) field, the data from the field with the selected check box is replaced with the * character and is not considered when the rule is applied.</p>
Serial number	<p>You can specify the full serial number of the device or use * and ? as a mask. * stands for any sequence of characters, including an empty sequence. ? stands for one character in a sequence.</p> <p>If the Use mask check box is selected for the Serial number field, the data from the field with the selected check box is replaced with the * character and is not considered when the rule is applied.</p> <p>If you selected the <b>Use a mask</b> option, but do not enter any characters in the <b>Serial number</b> field, then save the settings and close the window, the application applies * as a mask for the <b>Serial number</b> property and does not consider the field when the rule is applied.</p>
Device instance path	<p>Identifier of the connected device.</p> <p>You cannot modify the property. The field is for information only. The application does not apply the field for device control.</p>
Friendly name	<p>Device name set by the manufacturer.</p> <p>You cannot modify the property. The field is for information only. The application does not apply the field for device control.</p>
User or group of users	<p>You can specify a user account or a group of users that have access to the selected USB-devices.</p> <p>The operating system displays all connected USB-devices. You can access only the USB-drives for which you have the respective access rights.</p>
Description	<p>The default device description.</p> <p>If necessary, specify additional information about the rule in the Description field. For example, specify the devices affected by the rule.</p>

# Importing rules from the Kaspersky Security Center report on blocked devices

You can import data on blocked device connections from the report generated in Kaspersky Security Center after completion of the Device Control task in [Statistics only mode](#) and use this data to generate a list of Device Control allowing rules in the policy being configured.

When generating the report on events occurring during the Device Control task, you can keep track of the devices whose connection is restricted.

*To specify allowing rules for devices connection for a group of protected devices based on the Kaspersky Security Center report on blocked devices:*

1. In the policy properties, in the **Event notification** section, make sure that:

- For the **Critical Events** importance level the period of time for storing the task log for the *Untrusted external device detected and restricted* event exceeds the planned period of operation in the **Statistics only** mode (the default value is 30 days).
- For the **Warning** importance level the period of time for storing the task log for the *Statistics only: untrusted external device detected* event exceeds the planned period of task operation in the **Statistics only** mode (the default value is 30 days).

When the period for storing the events elapses, information about logged events is deleted and is not reflected in the report file. Before running the Device Control task in **Statistics only** mode, make sure that the task run time does not exceed the configured storage time for the specified events.

2. Start the Device Control task in the **Statistics only** mode.

- a. In the workspace of the **Administration Server** node in Kaspersky Security Center, select the **Events** tab.
- b. Click the **Create a selection** button and create a selection of events based on the *Untrusted external device detected and restricted* criterion to view the devices whose connections will be restricted by the Device Control task.
- c. In the results pane of the selection, click the **Export events to file** link to save the report on restricted connections to a TXT file.

Before importing and applying the generated report in a policy, make sure that the report contains data only on those devices whose connection you want to allow.

3. Import data about restricted devices connections into the Device Control task:

- a. [Open the Device Control rules window](#).
- b. Click the **Add** button and in the context menu of the button select **Import data of blocked devices from Kaspersky Security Center report**.
- c. Select the principle for adding rules from the list created on the basis of the Kaspersky Security Center report to the list of previously configured Device Control rules:

- **Add to existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are duplicated.
- **Replace existing rules** if you want to replace the existing rules with the imported rules.
- **Merge with existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.

d. In the standard window of Microsoft Windows that opens, select the TXT file to which events from the report about restricted devices have been exported.

e. Click the **Save** button in the **Device Control rules** window.

4. Click **OK** the **Device Control** window.

Rules created on the basis of the Kaspersky Security Center report on restricted devices are added to the list of Device Control rules.

## Creating rules using the Rule Generator for Device Control task

*To specify allowing device control rules for a group of protected devices using the Rule Generator for Device Control task:*

1. [Open the Settings window in the New Task Wizard.](#)

2. Configure the following:

- In the **Mode** section:
  - **Consider system data about all external devices that have ever been connected.**
  - **Consider currently connected external devices only.**
- In the **After task completes** section:
  - [Add allowing rules to the list of Device Control rules](#)
  - [Principle of adding](#)
  - [Export allowing rules to file](#)
  - [Add protected device details to file name](#)

3. Click **Next**.

4. In the **Schedule** window, set the scheduled task start settings.

5. Click **Next**.

6. In the **Selecting an account to run the task** window, specify the account you want to use.

7. Click **Next**.

8. Specify a task name.

9. Click **Next**.

The task name should be no longer than 100 characters and cannot contain the following symbols: " \* < > & \ : |

The **Finish creating the task** window opens.

10. You can optionally run the task after the Wizard finishes by selecting the **Run task after Wizard finishes** check box.

11. Click **Finish** to finish creating the task.

12. On the **Tasks** tab on the workspace of the group of protected devices being configured, in the list of group tasks select the Rule Generator for Device Control you have created.

13. Click the **Start** button to start the task.

When the task is completed, automatically generated lists of allowing rules are saved in a shared folder in XML files.

Before using the Device Control policy in the network, make certain that all protected devices have access to a shared network folder. If the organization's policy does not provide for the use of a shared network folder in the network, it is recommended to start the Rule Generator for Device Control task for protected device control rules on the test protected device group or on a template machine.

## Adding generated rules to the Device Control rules list

*To add the generated lists of allowing rules to the Device Control task:*

1. [Open the Device Control rules window](#).
2. Click the **Add** button.
3. In the **Add** button context menu select the **Import rules from XML file** option.
4. Select the principle for adding the automatically generated allowing rules to the list of previously created Device Control rules:
  - **Add to existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are duplicated.
  - **Replace existing rules** if you want to replace the existing rules with the imported rules.
  - **Merge with existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.
5. In the standard window of Microsoft Windows that opens, select XML files created after completion of the Rule Generator for Device Control group task.
6. Click **Open**.

All generated rules from the XML file are added to the list according to the selected principle.

7. Click the **Save** button in the **Device Control rules** window.

8. If you want to apply generated device control rules, select the **Active** task mode in the **Device Control** policy settings.

Allowing rules automatically generated based on system data on each separate protected device are applied to all network protected devices covered by the policy being configured. On these protected devices, the application will allow connection of only those devices for which allowing rules have been created.

## Managing Device Control via the Application Console

In this section, you will learn how to navigate the Application Console interface and configure task settings on a protected device.

### Navigation

Learn how to navigate to the required task settings via the chosen interface.

### Opening the Device Control task settings

*To open the Device Control task settings via the Application Console:*

1. In the Application Console tree, expand the **Computer Control** node.
2. Select the **Device Control** child node.
3. In the details pane of the **Device Control** child node, click the **Properties** link.  
The **Task settings** window opens.
4. Configure the task as required.

### Opening the Device Control rules window

*To open the Device Control rules list via the Application Console:*

1. In the Application Console tree, expand the **Computer Control** node.
2. Select the **Device Control** child node.
3. In the results pane of the **Device Control** node, click the **Device Control rules** link.  
The **Device Control rules** window opens.
4. Configure the rules list as required.

## Opening the Rule Generator for Device Control task settings

To configure the Rule Generator for Device Control task:

1. In the Application Console tree, expand the **Automated rule generators** node.
2. Select the **Rule Generator for Device Control** child node.
3. In the results pane of the **Rule Generator for Device Control** child node, click the **Properties** link.  
The **Task settings** window opens.
4. Configure the task as required.

## Configuring Device Control task settings

To configure the Device Control task settings:

1. [Open the Task settings window.](#)
2. On the **General** tab, configure the following task settings:
  - In the **Task mode** section, select one of the task modes:

- [Active](#) 

If an external device you consider to be untrusted is connected to a protected device before the Device Control task is run in the Active mode, the device is not blocked by the application. We recommend that you disconnect the untrusted device manually or restart the protected device. Otherwise, the Default Deny principle will not be applied to the device.

- [Statistics only](#) 

- Select or clear the [Allow using all external devices when the Device Control task is not running](#)  check box.

3. If necessary, on the **Schedule** and **Advanced** tabs, configure the [scheduled task start settings](#).
4. To edit the [list of device control rules](#), click the **Device Control rules** link in the lower part of the results pane of the **Device Control** node.

Kaspersky Embedded Systems Security immediately applies the new settings to the running task. Information about the date and time when the settings were modified, and the values of task settings before and after modification, are saved in the system audit log.

## Configuring Device Control rules

Learn how to generate, import and export a list of rules, or manually create allowing or denying rules using the Device Control task.

## Importing Device Control rules from XML file

*To import the Device Control rules:*

1. Open the [Device Control rules](#) window.
2. Click the **Add** button.
3. In the context menu of the button, select **Import rules from XML file**.
4. Specify the method for adding the imported rules. To do so, select one of the options from the context menu of the **Import rules from XML file** button:
  - **Add to existing rules** if you want to add the imported rules to the list of existing ones. Rules with identical settings are duplicated.
  - **Replace existing rules** if you want to replace the existing rules with the imported ones.
  - **Merge with existing rules** if you want to add the imported rules to the list of existing ones. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.

The standard Microsoft Windows **Open** window opens.

5. In the **Open** window, select the XML file that contains the settings of the Device Control rules.
6. Click the **Open** button.

The imported rules will be displayed in the list of the **Device Control rules** window.

## Filling rules list basing on Device Control task events

*To create a configuration file that contains device control rules list basing on the Device Control task events:*

1. Start the Device Control task in the [Statistics only](#) mode, to log all events of flash drives and other external devices connections to a protected device.
2. Upon the completion of the task in the **Statistics only** mode, open the task log by clicking the **Open task log** button in the **Management** section of the **Device Control** node results pane.
3. In the **Logs** window click the **Generate rules based on events**.

Kaspersky Embedded Systems Security will create an XML configuration file that contains a rules list generated basing on events of the Device Control task in the **Statistics only** mode. You can apply this list in the [Device Control task](#).

Before applying a rules list generated basing on the task events, it is recommended to review and then manually process the rules list to make certain that there are no untrusted devices allowed by the specified rules.

During the conversion of an XML file with the task events to a rules list, the application generates allowing rules for all registered events, including the devices restrictions.

All the task events are registered in the task log regardless of the task mode. You can create a configuration file with a rules list basing on the events of the task in the **Active** mode. This scenario is not recommended except urgent cases, as far as the task efficiency requires to generate a final rule list version before the task is run in the active mode.

## Adding an allowing rule for one or several external devices

The function of manual adding rules by ones is not supported in the Device Control task. However, in cases when you need to add rules for one or several new external devices you can use the **Generate rules based on system data** option. If this scenario is applied, the application uses Windows data about all ever connected external devices and also allows for currently connected devices for filling an allowing rules list.

*To add an allowing rule for one or several external devices that are currently connected:*

1. [Open the Device Control rules window](#).
2. Click the **Add** button.
3. In the context menu that opens select the **Generate rules based on system data** option.
4. In the window that opens, review the detected devices list and select a single device or several devices that you want to trust on a protected device.
5. Click the **Add rules for devices selected** button.

New rules will be generated and added to the device control rules list.

## Removing Device Control rules

*To remove the Device Control rules:*

1. Open the [Device Control rules](#) window.
2. In the list, select one or several rules that you want to delete.
3. Click the **Remove Selected** button.
4. Click the **Save** button.

The selected Device Control rules will be removed.

## Exporting Device Control rules

*To export Device Control rules to a configuration file:*

1. Open the [Device Control rules](#) window.

2. Click the **Export to a file** button.

The standard Microsoft Windows window opens.

3. In the window that opens, specify the file to which you want to export the rules. If no such file exists, it will be created. If a file with the specified name already exists, its contents will be rewritten after the rules are exported.

4. Click the **Save** button.

The rules and its settings will be exported in the specified file.

## Activating and deactivating of Device Control rules

You can activate and deactivate created device control rules without removing them.

*To activate or deactivate a created device control rule:*

1. Open the [Device Control rules](#) window.

2. In the list of specified rules open the **Rule properties** window by double clicking on the rule whose properties you want to configure.

3. In the window that opens, select or clear the [Apply rule](#)  check box.

4. Click **OK**.

Rule apply status will be saved and displayed for a specified rule.

## Expanding Device Control rules usage scope

Each automatically generated device control rule covers only one external device. You can manually expand a rule usage scope by setting the device instance path mask in properties of any specified rule.

Device instance path application reduces the total number of rules specified and simplifies rules processing. But expanding of a rule usage scope can lead to decreasing of external devices control efficiency.

*To apply a device instance path mask in a device control rule properties:*

1. Open the [Device Control rules](#) window.

2. In the window that opens, select a rule to use its properties for mask application.

3. Open the **Rule properties** window by double clicking on a selected device control rule.

4. In the window that opens, perform the following operations:

- Select the **Use mask** check box next to the **Manufacturer (VID)** field if you want the selected rule to allow connections for all external devices that fit the specified information about device manufacturer.
- Select the **Use mask** check boxes next to the **Controller type (PID)** field if you want the selected rule to allow connections for all external devices that fit the specified information about controller type.

- Select the **Use mask** check box next to the **Serial number** field if you want the selected rule to allow connections for all external devices that fit the specified information about device serial number.

If the **Use mask** check box is selected in at least one of the fields, the data from the fields with the selected check box is replaced with the \* character and is not considered when the rule is applied.

5. Specify a user account or a group of users that have access to the selected USB-devices. The operating system displays all connected USB-devices. You can access only the USB-devices for which you have the respective access rights.
6. If necessary, specify additional information about rule in the **User or group of users** field. For example, specify the devices affected by the rule.
7. Click **OK**.

The newly configured rule properties will be saved. The rule usage scope will be expanded according to a device instance path mask specified.

## Configuring Rule Generator for Device Control task

*To configure the Rule Generator for Device Control task:*

1. In the Application Console tree, expand the **Automated rule generators** node.
2. Select the **Rule Generator for Device Control** child node.
3. Click the **Properties** link in the results pane of the **Rule Generator for Device Control** node.  
The **Task settings** window opens.
4. On the **General** tab, select the task operation mode in the **Task mode** section:
  - **Consider system data about all external devices that have ever been connected.**
  - **Consider currently connected external devices only.**
5. In the **After task completes** section, specify the actions that must be performed by Kaspersky Embedded Systems Security upon task completion:
  - [Add allowing rules to the list of Device Control rules](#) 
  - [Principle of adding](#) 
  - [Export allowing rules to file](#) 
  - [Add protected device details to file name](#) 
6. On the **Schedule** and **Advanced** tabs, configure the [scheduled task start settings](#).
7. Click **OK** in the **Task settings** window.

Kaspersky Embedded Systems Security immediately applies the new settings to the running task. Information about the date and time when the settings were modified, and the values of task settings before and after modification, are saved in the system audit log.

## Managing Device Control via the Application Console Web Plug-in

In this section, you will learn how to navigate the Web Plug-in interface and configure task settings on a protected device.

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **Local activity control** section.
5. Click **Settings** in the **Device control** subsection.
6. Configure the settings described in the table below.

Device Control task settings

Setting	Description
<b>Active</b>	Kaspersky Embedded Systems Security applies rules to control the connection of removable drives and other external devices, and allows or blocks the use of all devices according to the Default Deny principle and specified allowing rules. The use of trusted external devices is allowed. The use of untrusted external devices is blocked by default.
<b>Statistics only</b>	Kaspersky Embedded Systems Security does not control the connection of removable drives and other external devices, but only logs information about the connection and registration of external devices on a protected device, and about the Device Control allowing rules triggered by the connected devices. The use of all external devices is allowed. This mode is set by default.
<b>Allow using all external devices when the Device Control task is not running</b>	<p>The check box allows or blocks the use of external devices when the Device Control task is not running.</p> <p>If the check box is selected and Device Control task is not running, Kaspersky Embedded Systems Security allows using any external devices on a protected device.</p> <p>If the check box is cleared, the application blocks the use of untrusted external devices on a protected device in the following cases: the Device Control task is not running or the Kaspersky Security Service is turned off. This option is recommended to maximize the level of protection against computer security threats arising when exchanging files with external devices.</p> <p>The check box is cleared by default.</p>
<b>Device control rules</b>	You can edit the <a href="#">list of Device control rules</a> .
Task management	You can configure settings to start the task on a schedule.

# Firewall Management

This section contains information about the Firewall Management task and how to configure it.

## About the Firewall Management task

Kaspersky Embedded Systems Security provides a reliable and convenient solution for protecting network connections using the Firewall Management task.

The Firewall Management task does not perform independent network traffic filtering, but it lets you manage Windows Firewall through the Kaspersky Embedded Systems Security graphical interface. During the Firewall Management task Kaspersky Embedded Systems Security takes over management of the settings and policies of the operation system's firewall and blocks any external attempts to configure the firewall.

During installation of the application, the Firewall Management component reads and copies the Windows Firewall status and all specified rules. After that, the set of rules and the rule parameters may only be changed, and the firewall may only be turned on or off in Kaspersky Embedded Systems Security.

If Windows Firewall is turned off during installation of Kaspersky Embedded Systems Security, the Firewall Management task will not be executed after the installation is complete. If Windows Firewall is turned on during installation of the application, the Firewall Management task is executed after the installation is complete, blocking all network connections that are not allowed by the specified rules.

The Firewall Management component is not installed by default, as it is not included in the set of components in the Recommended Installation.

The Firewall Management task enforces blocking of all incoming and outgoing connections not allowed by the task's specified rules.

The task polls the Windows Firewall regularly and monitors its status. By default, the polling interval is set to 1 minute and cannot be changed. If Kaspersky Embedded Systems Security detects a mismatch between the Windows Firewall settings and the Firewall Management task settings, the application forcibly applies the task settings to the operating system firewall.

Polling Windows Firewall each minute, Kaspersky Embedded Systems Security monitors the following:

- Operating status of the Windows Firewall.
- Status of rules added by other applications or tools (for example, the addition of a new application rule for a port/application using wf.msc) after installation of Kaspersky Embedded Systems Security.

When applying new rules to Windows Firewall, Kaspersky Embedded Systems Security creates a Kaspersky Security Group rule set in the Windows Firewall snap-in. This rule set contains all the rules created by Kaspersky Embedded Systems Security using the Firewall Management task. The rules in the Kaspersky Security Group are not monitored by the application during polling and are not automatically synchronized with the list of rules specified in the Firewall Management task settings.

*To update the Kaspersky Security Group rules manually,*

restart the Kaspersky Embedded Systems Security Firewall Management task.

You can also edit the Kaspersky Security Group rules manually using the Windows Firewall snap-in.

If Windows Firewall is managed by a Kaspersky Security Center group policy, the Firewall Management task cannot be started.

## About Firewall rules

The Firewall Management task controls filtration of incoming and outgoing network traffic using allowing rules forcibly applied to the Windows Firewall during task execution.

The first time the task is started Kaspersky Embedded Systems Security reads and copies all the incoming network traffic rules specified in the Windows Firewall settings to the Firewall Management task settings. Then the application operates according to the following rules:

- If a new rule is created in the Windows Firewall settings (manually or automatically during a new application installation), Kaspersky Embedded Systems Security deletes the rule.
- If an existing rule is deleted from the Windows Firewall settings, Kaspersky Embedded Systems Security restores the rule when the task is restarted.
- If the parameters of an existing rule are changed in the Windows Firewall settings, Kaspersky Embedded Systems Security rolls back the changes.
- If a new rule is created in the Firewall Management settings, Kaspersky Embedded Systems Security forcibly applies the rule to Windows Firewall.
- If an existing rule is deleted from the Firewall Management settings, Kaspersky Embedded Systems Security forcibly deletes the rule from the Windows Firewall settings.

You can manage different types of Firewall rules: for applications and for ports.

## Behavior of the default rules when you install and remove the application

During installation, a set of allowing rules is created to prevent the applications installed along with Kaspersky Embedded Systems Security from being blocked and to ensure their continuous operation. Following are the details and limitations.

By default, Kaspersky Embedded Systems Security creates a set of rules for incoming network traffic when you install the application on a device that runs any supported version of Windows OS:

- Allowing rules for Kaspersky Embedded Systems Security Console, located in the application installation folder. Status: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.
- Two allowing rules for local port 15000, if Kaspersky Security Center Network Agent is installed on the device. State: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.

By default, Kaspersky Embedded Systems Security creates a set of rules for outgoing network traffic when you install the application on a device that runs Windows 7 or later:

- Allowing rules for Kaspersky Security Management, located in the application installation folder. State: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.

- Allowing rules for Kaspersky Embedded Systems Security, located in the application installation folder. State: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.
- Two allowing rules for local port 13000, if Kaspersky Security Center Network Agent is installed on the device. State: enabled. Allowed external addresses: Any. Protocols: TCP and UPD – one rule per protocol.

When you uninstall Kaspersky Embedded Systems Security, the application removes all created Firewall rules, except for the rules created by Kaspersky Security Center Network Agent, such as Kaspersky Security Center WDS and Kaspersky Administration Kit. Also, the application removes the rules for ICMPv4 and ICMPv6 for Windows 7 and later.

When you uninstall Kaspersky Embedded Systems Security, the application enables all ICMP connections for operating systems earlier than Windows 7.

## Application rules

This type of rule allows targeted network connections for specified applications. The triggering criterion for these rules is based on a path to an executable file.

You can manage application rules:

- Add new rules.
- Remove existing rules.
- Enable or disable specified rules.
- Edit the parameters of the specified rules: specify the rule name, path to the executable file, and the rule usage scope.

## Port rules

This type of rule allows network connections for specified ports and protocols (TCP / UDP). The triggering criteria for these rules are based on the port number and protocol type.

You can manage port rules:

- Add new rules.
- Remove existing rules.
- Enable or disable specified rules.
- Edit the parameters of the specified rules: set the rule name, port number, protocol type, and scope for application of the rule.

Port rules involve a broader scope than application rules. By allowing connections based on port rules, you lower the security level of the protected device.

## Default Firewall Management task settings

The Firewall Management task uses the default settings described in the table below. You can change the values of these settings.

Default Firewall Management task settings

Setting	Default value	Description
<b>Inbound connections</b>	<b>Block</b>	<p>You can configure the settings for incoming traffic rules to block or allow inbound connections.</p> <p>By default, type of the rule is opposite to the policy type. For example, for the Default deny policy, the default value for the rule is set to <b>Allow</b>. For the Default allow policy, the default value for the rule is set to <b>Block</b>. You can change the type of the rule as applicable.</p>
<b>Outbound connections</b>	<b>Allow</b>	<p>You can configure the settings for outgoing traffic rules to block or allow outbound connections.</p> <p>By default, type of the rule is opposite to the policy type. For example, for the Default deny policy, the default value for the rule is set to <b>Allow</b>. For the Default allow policy, the default value for the rule is set to <b>Block</b>. You can change the type of the rule as applicable.</p>
<b>Enable ICMP connections</b>	<b>Disabled</b>	<p>This option controls incoming and outgoing ICMP connections simultaneously via ICMPv4 and ICMPv6 protocols.</p> <p>If the option is enabled, Kaspersky Embedded Systems Security ignores the <b>Block</b> value configured for the inbound connection or outbound connection settings. The selected <b>Enable ICMP connections</b> option is of a higher priority.</p>
Task start schedule	N/A	<p>The Firewall Management task does not start automatically at the start of Kaspersky Embedded Systems Security.</p> <p>You can configure the task start schedule.</p>

## Managing Firewall rules via the Administration Plug-in

In this section, learn how to manage Firewall rules via the Administration Plug-in interface.

### Enabling and disabling Firewall rules

*To enable or disable an existing rule for filtering incoming network traffic, perform the following actions:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Network activity control** section, click the **Settings** button in the **Firewall Management** subsection.
5. Click the **Rules list** button in the window that opens.  
The **Inbound Firewall rules** window opens.
6. Depending on the type of the rule whose status you want to modify, click **Inbound** or **Outbound** link, and then select the **Applications** or **Ports** tab.
7. In the rule list, select the rule whose status you want to modify and perform one of the following actions:
  - If you want to enable a disabled rule, select the check box to the left of the rule name.  
The selected rule is enabled.
  - If you want to disable an enabled rule, clear the check box to the left of the rule name.  
The selected rule is disabled.
8. Click **OK** in the **Inbound Firewall rules** window.
9. Click **OK** in the **Firewall Management** window.
10. Click **OK** in the **Properties: <Policy name>** window.

The specified task settings are saved. The new rule parameters will be sent to Windows Firewall.

## Adding Firewall rules manually

You can only add and edit rules for applications and ports. You cannot add new or edit existing group rules.

*To add a new or edit an existing rule for filtering incoming network traffic:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Network activity control** section, click the **Settings** button in the **Firewall Management** subsection.

5. In the **Firewall Management** window that appears, on the **General** tab, click the **Rules list** button next to **Inbound or Outbound** subsection depending on the type of connection that you want to configure.

When you configure the rules for inbound and outbound connections, note the following options and limitations:

- By default, type of the rule is opposite to the policy type. For example, for the Default deny policy, the default value for the rule is set to **Allow**. For the Default allow policy, the default value for the rule is set to **Block**. You can change the type of the rule as applicable.
- You can configure the default task settings, if you connect a local Application Console to a remote device that runs any OS or if you connect a local Application Console to a local device that runs Windows 7 or later.
- Configuring the default Firewall task settings is unavailable, if you connect a local Application Console to a local device that runs an operating system earlier than Windows 7.

6. In the window that appears, select the **Applications** or **Ports** tab and perform one of the following actions:

- To edit an existing rule, select the rule you want to edit in the rule list and click **Edit**.
- To add a new rule, click **Add**.

Depending on the type of rule being configured, the **Application rule** window or **Port rule** window opens.

7. In the window that appears, perform the following operations:

- If you are working with an application rule, do the following:
  - a. In the **Rule name** field, enter the name of the edited rule.
  - b. On the **Rule action** list, select the **Allow** or **Block** option as applicable.
  - c. Specify the **Application path** to the executable file of the application for which you are allowing a connection by modifying the rule.  
You can set the path manually or by using the **Browse** button.
  - d. In the **Rule action** field, specify the network addresses for which the modified rule will be applied.

You can only use IPv4 addresses.

- If you are working with a port rule, do the following:
  - a. In the **Rule name** field enter the name of the edited rule.
  - b. On the **Rule action** list, select the **Allow** or **Block** option as applicable.
  - c. In the **Local port** subsection, specify **Port number** or **Port range** as applicable.

When you set up the ports to establish a network connection, note the following options and limitations.

For inbound connections, you define the port settings for a local device. For outbound connections, you define the port settings for remote devices.

For the **Port number** option, available values are 1–65535.

For the **Port range** option, available values are 1–10, 20–30000, and 1–65535.

The port settings limitations are as follows:

- To set up a network connection for a local device run under Windows XP, you can specify only one port in the port settings, as Windows XP does not support the port range settings.
- To set up a network connection for a remote device run under Windows XP, you can specify **Port range**, but the rule is applied only to the first port of the defined range, as Windows XP does not support the port range settings.

d. Select the type of protocol (TCP / UDP) for which the application will allow connections.

e. In the **Rule action** field, specify the network addresses for which the modified rule will be applied.

You can only use IPv4 addresses.

8. Click **OK** in the **Application rule** or **Port rule** window.

9. Click **OK** in the **Firewall Management** window.

10. Click **OK** in the **Properties: <Policy name>** window.

The specified task settings are saved. The new rule parameters will be sent to Windows Firewall.

## Deleting Firewall rules

You can only delete application and port rules. You cannot delete existing group rules.

*To delete an existing rule for filtering incoming network traffic, perform the following actions:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Network activity control** section click the **Settings** button in the **Firewall Management** subsection.
5. Click the **Rules list** button in the window that opens.  
The **Inbound Firewall rules** window opens.
6. Depending on the type of rule whose status you want to modify, select the **Applications** or **Ports** tab.
7. In the rule list, select the rule you want to delete.
8. Click the **Delete** button.  
The selected rule is deleted.
9. Click **OK** in the **Inbound Firewall rules** window.
10. Click **OK** in the **Firewall Management** window.
11. Click **OK** in the **Properties: <Policy name>** window.

The specified Firewall Management task settings are saved. The new rule parameters will be sent to Windows Firewall.

## Managing Firewall rules via the Application Console

In this section, learn how to manage Firewall rules via the Application Console interface.

### Enabling and disabling Firewall rules

*To enable or disable an existing rule for filtering incoming network traffic, perform the following actions:*

1. In the Application Console tree, expand the **Computer Control** node.
2. Select the **Firewall Management** child node.
3. Click the **Firewall rules** link in the details pane of the **Firewall Management** node.  
The **Firewall rules** window appears.
4. Depending on the type of the rule whose status you want to modify, click **Inbound** or **Outbound** link, and then select the **Applications** or **Ports** tab.
5. In the rule list, select the rule whose status you want to modify and perform one of the following actions:
  - If you want to enable a disabled rule, select the check box to the left of the rule name.  
The selected rule is enabled.
  - If you want to disable an enabled rule, clear the check box to the left of the rule name.  
The selected rule is disabled.

6. Click **Save** in the **Firewall rules** window.

The specified task settings are saved. The new rule parameters will be sent to Windows Firewall.

## Adding Firewall rules manually

*To add a new or edit an existing rule for filtering incoming network traffic:*

1. In the Application Console tree, expand the **Computer Control** node.
2. Select the **Firewall Management** child node.
3. Depending on the type of connection that you want to configure, click the [Inbound or Outbound connection?](#) link in the details pane of the **Firewall Management** node.

When you configure the rules for inbound and outbound connections, note the following options and limitations:

- By default, type of the rule is opposite to the policy type. For example, for the Default deny policy, the default value for the rule is set to **Allow**. For the Default allow policy, the default value for the rule is set to **Block**. You can change the type of the rule as applicable.
- You can configure the default task settings, if you connect a local Application Console to a remote device that runs any OS or if you connect a local Application Console to a local device that runs Windows 7 or later.
- Configuring the default Firewall task settings is unavailable, if you connect a local Application Console to a local device that runs an operating system earlier than Windows 7.

4. In the window that appears, select the **Applications** or **Ports** tab and perform one of the following actions:

- To edit an existing rule, select the rule you want to edit in the rule list and click **Edit**.
- To add a new rule, click **Add**.

Depending on the type of rule being configured, the **Application rule** window or **Port rule** window opens.

5. In the window that appears, perform the following operations:

- If you are working with an application rule, do the following:
  - a. In the **Rule name** field, enter the name of the edited rule.
  - b. On the **Rule action** list, select the **Allow** or **Block** option as applicable.
  - c. Specify the **Application path** to the executable file of the application for which you are allowing a connection by modifying the rule.  
You can set the path manually or by using the **Browse** button.
  - d. In the **Rule action** field, specify the network addresses for which the modified rule will be applied.

You can only use IPv4 addresses.

- If you are working with a port rule, do the following:
  - a. In the **Rule name** field enter the name of the edited rule.
  - b. On the **Rule action** list, select the **Allow** or **Block** option as applicable.
  - c. In the **Local port** subsection, specify **Port number**  or **Port range**  as applicable.

When you set up the ports to establish a network connection, note the following options and limitations.

For inbound connections, you define the port settings for a local device. For outbound connections, you define the port settings for remote devices.

For the **Port number** option, available values are 1–65535.

For the **Port range** option, available values are 1–10, 20–30000, and 1–65535.

The port settings limitations are as follows:

- To set up a network connection for a local device run under Windows XP, you can specify only one port in the port settings, as Windows XP does not support the port range settings.
- To set up a network connection for a remote device run under Windows XP, you can specify **Port range**, but the rule is applied only to the first port of the defined range, as Windows XP does not support the port range settings.

- d. Select the type of protocol (TCP / UDP) for which the application will allow connections.
- e. In the **Rule action** field, specify the network addresses for which the modified rule will be applied.

You can only use IPv4 addresses.

6. Click **OK** in the **Application rule** or **Port rule** window.
7. Click **Save** in the **Firewall rules** window.

The specified task settings are saved. The new rule parameters will be sent to Windows Firewall.

## Deleting Firewall rules

You can only delete application and port rules. You cannot delete existing group rules.

*To delete an existing rule for filtering incoming network traffic, perform the following actions:*

1. In the Application Console tree, expand the **Computer Control** node.
2. Select the **Firewall Management** child node.
3. Click the **Firewall rules** link in the details pane of the **Firewall Management** node.  
The **Firewall rules** window appears.

4. Depending on the type of rule whose status you want to modify, select the **Applications** or **Ports** tab.
5. In the rule list, select the rule you want to delete.
6. Click the **Delete** button.  
The selected rule is deleted.
7. Click **Save** in the **Firewall rules** window.

The specified task settings are saved. The new rule parameters will be sent to Windows Firewall.

## Managing Firewall rules via the Web Plug-in

*To configure the Firewall rules via the Web Plug-in:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **Network activity control** section.
5. Click **Settings** in the **Firewall Management** subsection.
6. Configure the settings described in the table below.

Firewall Management task settings

Setting	Description
<b>Application rules</b>	You can manage application rules. This type of rule allows targeted network connections for specified applications. The triggering criterion for these rules is based on a path to an executable file.
<b>Port rules</b>	You can manage port rules. This type of rule allows network connections for specified ports and protocols (TCP / UDP). The triggering criteria for these rules are based on the port number and protocol type.
<b>Task management</b>	You can configure settings to start the task on a schedule.

## Enabling and disabling Firewall rules

*To enable or disable an existing rule for filtering incoming network traffic, perform the following actions:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.

4. Select the **Network activity control** section.
5. Click **Settings** in the **Firewall Management** subsection.
6. Depending on the type of the rule whose status you want to modify, select the **Application rules** or **Port rules** tab.
7. In the rule list, select the rule whose status you want to modify and perform one of the following actions:
  - If you want to enable a disabled rule, switch on the toggle button to the left of the rule name.
  - If you want to disable an enabled rule, switch off the toggle button to the left of the rule name.
8. Click **OK**.

The specified task settings are saved. The new rule parameters will be sent to Windows Firewall.

## Adding Firewall rules manually

*To add a new or edit an existing rule for filtering incoming network traffic:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **Network activity control** section.
5. Click **Settings** in the **Firewall Management** subsection.
6. Depending on the type of the rule whose status you want to modify, select the **Applications Inbound or Outbound rules** tab or **Ports Inbound or Outbound rules** tab, and perform one of the following actions:

When you configure the rules for inbound and outbound connections, note the following options and limitations:

- By default, type of the rule is opposite to the policy type. For example, for the Default deny policy, the default value for the rule is set to **Allow**. For the Default allow policy, the default value for the rule is set to **Block**. You can change the type of the rule as applicable.
- You can configure the default task settings, if you connect a local Application Console to a remote device that runs any OS or if you connect a local Application Console to a local device that runs Windows 7 or later.
- Configuring the default Firewall task settings is unavailable, if you connect a local Application Console to a local device that runs an operating system earlier than Windows 7.

- To edit an existing rule, select the rule you want to edit and click **Edit**.
  - To add a new rule, click **Add**.
7. On the right part of the screen, perform the following operations:

- If you are working with an application rule, do the following:
  - a. Select the **Use the rule** check box, if you want to apply the created rule.
  - b. In the **Rule name** field enter the name of the edited rule.
  - c. On the **Rule action** list, select the **Allow** or **Block** option as applicable.
  - d. Specify the **Application path** to the executable file of the application for which you are allowing a connection by modifying this rule.
  - e. In the **Rule application scope** field, specify the network addresses for which the modified rule will be applied.

You can only use IPv4 addresses.

- If you are working with a port rule, do the following:
  - a. Select the **Use the rule** check box, if you want to apply the created rule.
  - b. In the **Rule name** field enter the name of the edited rule.
  - c. Specify the **Port number or Port range**  for which the application will allow connections.

When you set up the ports to establish a network connection, note the following options and limitations.

For inbound connections, you define the port settings for a local device. For outbound connections, you define the port settings for remote devices.

For the **Port number** option, available values are 1–65535.

For the **Port range** option, available values are 1–10, 20–30000, and 1–65535.

The port settings limitations are as follows:

- To set up a network connection for a local device run under Windows XP, you can specify only one port in the port settings, as Windows XP does not support the port range settings.
- To set up a network connection for a remote device run under Windows XP, you can specify **Port range**, but the rule is applied only to the first port of the defined range, as Windows XP does not support the port range settings.

- d. Select the type of protocol (TCP / UDP) for which the application will allow connections.
- e. In the **Rule application scope** field, specify the network addresses for which the modified rule will be applied.

You can only use IPv4 addresses.

8. Click **OK**.

9. Click **OK** in the **Firewall Management** window.

The specified task settings are saved. The new rule parameters will be sent to Windows Firewall.

## Deleting Firewall rules

You can only delete application and port rules. You cannot delete existing group rules.

*To delete an existing rule for filtering incoming network traffic, perform the following actions:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **Network activity control** section.
5. Click **Settings** in the **Firewall Management** subsection.
6. Depending on the type of the rule you want to delete, select the **Application rules** or **Port rules** tab.
7. In the rule list, select the rule you want to delete.
8. Click the **Delete** button.  
The selected rule is deleted.
9. Click **OK**.

The specified task settings are saved. The new rule parameters will be sent to Windows Firewall.

# File Integrity Monitor

This section contains information about starting and configuring the File Integrity Monitor task.

## About the File Integrity Monitor task

The File Integrity Monitor task is designed to track actions performed with the specified files and folders in the monitoring scopes specified in the task settings. You can use the task to detect file changes that may indicate a security breach on the protected device. You can also configure file changes to be tracked during periods in which monitoring is interrupted.

A *monitoring interruption* occurs when the monitoring scope temporarily falls outside the scope of the task, e.g. if the task is stopped or if an external device is not physically present on a protected device. Kaspersky Embedded Systems Security reports detected file operations in the monitoring scope as soon as an external device is reconnected.

If the task stops running in the specified monitoring scope due to a reinstallation of the File Integrity Monitor component, this does not constitute a monitoring interruption. In this case, the File Integrity Monitor task is not run.

## Requirements on the environment

To start the File Integrity Monitor task, the following conditions must be satisfied:

- ReFS or NTFS file systems must be used on the protected device.
- The Windows USN Journal must be enabled. The component queries this journal to receive information about file operations.

If you enable USN Journal after a rule has been created for a volume and the File Integrity Monitor task has been started, the task must be restarted. If not, the rule will not be applied during monitoring.

## Excluded monitoring scopes

You can create excluded [monitoring scopes](#). Exclusions are specified for each separate rule and work only for the indicated monitoring scope. You can specify an unlimited number of exclusions for each rule.

Exclusions have higher priority than the monitoring scope and are not monitored by the task, even if an indicated folder or file is in the monitoring scope. If the settings for one of the rules specify a monitoring scope at a lower level than a folder specified in exclusions, the monitoring scope is not considered when the task is run.

To specify exclusions, you can use the same masks that are used to specify monitoring scopes.

## About file operation monitoring rules

The File Integrity Monitor task is run based on file operation monitoring rules. You can use rule triggering criteria to configure the conditions that trigger the task, and adjust the importance level for detected file operation events recorded in the task log.

A file operation monitoring rule is specified for each monitoring scope.

You can configure the following rule triggering criteria:

- Trusted users
- File operation markers

## Trusted users

By default, the application treats all user actions as potential security breaches. The trusted user list is empty. You can configure the event importance level by creating a list of trusted users in the file operation monitoring rule settings.

*Untrusted user* is a status assigned to any user not indicated in the trusted user list in the monitoring scope rule settings. If Kaspersky Embedded Systems Security detects a file operation performed by an untrusted user, the File Integrity Monitor task records a Critical event in the task log.

*Trusted user* is a status assigned to a user or group of users authorized to perform file operations in the specified monitoring scope. If Kaspersky Embedded Systems Security detects file operations performed by a trusted user, the File Integrity Monitor task records an Informational event in the task log.

Kaspersky Embedded Systems Security cannot determine the users that initiate operations during monitoring interruptions. In this case, the user status is determined to be unknown.

*Unknown user* is a status assigned to a user if Kaspersky Embedded Systems Security cannot receive information about a user due to a task interruption or a failure of the data synchronization driver or USN Journal. If Kaspersky Embedded Systems Security detects a file operation performed by an unknown user, the File Integrity Monitor task records a *Warning* event in the task log.

## File operation markers

When the File Integrity Monitor task runs, Kaspersky Embedded Systems Security uses file operation markers to determine that an action has been performed on a file.

A file operation marker is a unique descriptor that can characterize a file operation.

Each file operation can be a single action or a chain of actions with files. Each action of this kind is equated to a file operation marker. If the marker you specify as a rule triggering criterion is detected in a file operation chain, the application logs an event indicating that the given file operation was performed.

The importance level of the logged events does not depend on the selected file operation markers or the number of events.

By default, Kaspersky Embedded Systems Security considers all available file operation markers. You can select file operation markers manually in the task's rule settings.

### File operation markers

File operation ID	File operation marker	Supported file
-------------------	-----------------------	----------------

		systems
BASIC_INFO_CHANGE	Attributes or time markers of a file or folder changed	NTFS, ReFS
COMPRESSION_CHANGE	Compression of a file or folder changed	NTFS, ReFS
DATA_EXTEND	Size of file or folder increased	NTFS, ReFS
DATA_OVERWRITE	Data in a file or folder was overwritten	NTFS, ReFS
DATA_TRUNCATION	File or folder truncated	NTFS, ReFS
EA_CHANGE	Extended file or folder attributes changed	Only NTFS
ENCRYPTION_CHANGE	Encryption status of file or folder changed	NTFS, ReFS
FILE_CREATE	File or folder created for the first time	NTFS, ReFS
FILE_DELETE	File or folder permanently deleted using a SHIFT+DEL combination	NTFS, ReFS
HARD_LINK_CHANGE	Hard link created or deleted for file or folder	Only NTFS
INDEXABLE_CHANGE	Index status of file or folder changed	NTFS, ReFS
INTEGRITY_CHANGE	Integrity attribute changed for a named file stream	Only ReFS
NAMED_DATA_EXTEND	Size of a named file stream increased	NTFS, ReFS
NAMED_DATA_OVERWRITE	Named file stream overwritten	NTFS, ReFS
NAMED_DATA_TRUNCATION	Named file stream truncated	NTFS, ReFS
OBJECT_ID_CHANGE	File or folder identifier changed	NTFS, ReFS
RENAME_NEW_NAME	New name assigned to file or folder	NTFS, ReFS
REPARSE_POINT_CHANGE	New reparse point created or existing reparse point changed for a file or folder	NTFS, ReFS
SECURITY_CHANGE	File or folder access rights changed	NTFS, ReFS
STREAM_CHANGE	New named file stream created or existing named file stream changed	NTFS, ReFS
TRANSACTIONED_CHANGE	Named file stream changed by TxF transaction	Only ReFS

## Default File Integrity Monitor task settings

By default, the File Integrity Monitor task has the settings described in the table below. You can change the values of the settings in the following components:

- [The Administration Plug-in](#)
- [The Application Console](#)
- [The Web Plug-in](#)

Default File Integrity Monitor task settings

Setting	Default value	Description
<b>Monitoring scope</b>	Not configured	Use this option to specify the folders and files for which actions will be monitored. Monitoring events will be generated for the

		folders and files in the specified monitoring scope.
<b>Trusted users list</b>	Not configured	Use this option to specify users and/or groups of users, whose actions in the specified folders will be treated as safe by the component.
<b>Log information about file operations that appear during the monitor interruption period</b>	Used	Use this option to enable or disable logging of file operations performed in the indicated monitoring scopes during periods in which the task is not running.  By default, statistics is compiled for untrusted and unknown users and objects.
<b>Block attempts to compromise the USN log</b>	Used	Use this option to enable or disable protection of the USN log.
<b>Apply Trusted Zone</b>	Disabled	Select or clear the <b>Apply Trusted Zone</b> check box to apply the <b>Trusted Zone</b> exclusions in addition to the monitoring scope configured for a rule.
<b>Detect and block all file operations in the selected area</b>	Disabled	Select or clear the <b>Detect and block all file operations in the selected area</b> check box if you want to block all changes for the selected monitoring area.
<b>Exclude the following folders from control</b>	Not applied	Use this option to check the use of exclusions for folders in which file operations do not need to be monitored. When the File Integrity Monitor task runs, Kaspersky Embedded Systems Security skips monitoring scopes specified as exclusions.
<b>Checksum calculation</b>	Not applied	Use this option to configure calculation of the file checksum after changes are made in the file.
<b>Set file operation markers</b>	All available file operation markers are considered	Use this option to specify the set of file operation markers. If a file operation performed in a monitoring scope is characterized by one or more specified markers, Kaspersky Embedded Systems Security generates an audit event.
Task start schedule	First run is not scheduled	You can configure the settings for starting the task on a schedule.

## Manage File Integrity Monitor via the Administration Plug-in

In this section, learn how to configure the File Integrity Monitor task via the Administration Plug-in.

### Configuring the File Integrity Monitor task

To configure general File Integrity Monitor task settings:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:

- To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
- To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **System inspection** section in the **File Integrity Monitor** subsection, click the **Settings** button.

The **File Integrity Monitor** window opens.

5. In the **File operations monitoring settings** tab in the window that appears, configure the following settings:

- Clear or select the [Log information about file operations that appear during the monitoring interruption period](#)  check box.

The check box enables or disables monitoring of the file operations specified in the File Integrity Monitor task settings when the task is not running for any reason (removal of a hard disk, task stopped by user, software error).

If the check box is selected, Kaspersky Embedded Systems Security will record events in all monitoring scopes when the File Integrity Monitor task is not running.

If the check box is cleared, the application will not log file operations in monitoring scopes when the task is not running.

The check box is selected by default.

- Clear or select the [Block attempts to compromise the USN log](#)  check box.

The check box enables or disables protection of the USN log.

If the check box is selected, Kaspersky Embedded Systems Security will block attempts to delete the USN log or to compromise the USN log's content.

If the check box is cleared, the application will not monitor changes to the USN log.

The check box is selected by default.

- Select or clear the [Apply Trusted Zone](#)  check box as applicable.

If the **Apply Trusted Zone** check box is selected, the **Exclusions** and **Trusted processes** configured in the **Trusted Zone** are applied to the monitoring scope in addition to the configured rule.

If the **Apply Trusted Zone** check box is cleared, the **Exclusions** and **Trusted processes** configured in the **Trusted Zone** are not applied to the monitoring scope.

By default, the check box is cleared.

- Add the [monitoring scopes](#) to be monitored by the task.

6. On the **Task management** tab, configure the task settings for starting the task on a [schedule](#).

7. Click **OK** to save the changes.

Kaspersky Embedded Systems Security immediately applies the new settings to the running task. Information about the date and time of settings modification are saved in the system audit log.

## Configuring monitoring rules

To add a monitoring scope:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **System inspection** section in the **File Integrity Monitor** subsection, click the **Settings** button.  
The **File Integrity Monitor** window opens.
5. In the **Monitoring scope** section, click the **Add** button.  
The **File operations monitoring rule** window opens.
6. Add a monitoring scope in one of the following ways:
  - If you want to select folders through the standard Microsoft Windows dialog:
    - a. Click the **Browse** button.  
The standard Microsoft Windows **Browse for folder** window opens.
    - b. In the **Browse for folder** window that opens, select the folder for which you want to monitor operations, and then click the **OK** button.
  - If you want to specify a monitoring scope manually, add a path using a supported mask:
    - `<*.ext>` – all files with the extension `<ext>`, regardless of their location
    - `<*\name.ext>` – all files with name `<name>` and extension `<ext>`, regardless of their location
    - `<\dir\*>` – all files in folder `<\dir>`
    - `<\dir\*\name.ext>` – all files with the name `<name>` and extension `<ext>` in folder `<\dir>` and all of its child folders

When specifying a monitoring scope manually, be sure that the path is in the following format: <volume letter>:\<mask>. If the volume letter is missing, Kaspersky Embedded Systems Security will not add the specified monitoring scope.

7. On the **Trusted users** tab, click the **Add** button.

The standard Microsoft Windows **Select Users or Groups** window appears.

8. Select the users or groups of users for whom file operations are allowed in the selected monitoring scope, and click the **OK** button.

By default, Kaspersky Embedded Systems Security treats all users not on the [trusted user list as untrusted](#), and generates Critical events for them. For trusted users, statistics are compiled.

9. Select the **File operation markers** tab.

10. Perform the following actions to select several markers as applicable:

- a. Select the **Detect file operations based on the following markers** option.
- b. On the [list of available file operations](#) select the check boxes next to the operations you want to monitor.

By default Kaspersky Embedded Systems Security detects all file operation markers, the **Detect file operations based on all recognizable markers** option is selected.

11. If you want to block all file operations for the selected area, select the **Detect and block all file operations in the selected area** check box.

12. If you want Kaspersky Embedded Systems Security to calculate a file checksum after an operation is performed, do the following:

a. Select the [Calculate checksum for the file if possible. The checksum will be available for viewing in the task report](#) check box.

b. In the **Checksum type** drop down list, select one of the options:

- **MD5 hash**
- **SHA256 hash**

13. If you do not want to monitor all file operations in the [list of available file operations](#), select the check boxes next to the operations you want to monitor.

14. Add excluded monitoring scopes as applicable:

a. Select the **Exclusions** tab.

b. Select the [Exclude the following folders from control](#) check box.

c. Click the **Add** button.

The **Select folder to add** window opens.

d. In the window that opens, specify the folder that you want to exclude from the monitoring scope.

e. Click **OK**.

The specified folder is added to the list of excluded scopes.

15. Click **OK** in the **File operations monitoring rule** window.

The specified rule settings are applied to the selected monitoring scope of the File Integrity Monitor task.

## Manage File Integrity Monitor via the Application Console

In this section, learn how to configure the File Integrity Monitor task via the Application Console.

### Configuring File Integrity Monitor task settings

*To configure general File Integrity Monitor task settings:*

1. In the Application Console tree, expand the **System Inspection** node.

2. Select the **File Integrity Monitor** child node.

3. Click the **Properties** link in the results pane of the **File Integrity Monitor** node.

The **Task settings** window appears.

4. In the appeared window, on the **General** tab, configure the following settings:

a. Clear or select the [\*\*Log information about file operations that appear during the monitor interruption period\*\*](#)  check box.

The check box enables or disables monitoring of the file operations specified in the File Integrity Monitor task settings when the task is not running for any reason (removal of a hard disk, task stopped by user, software error).

If the check box is selected, Kaspersky Embedded Systems Security will record events in all monitoring scopes when the File Integrity Monitor task is not running.

If the check box is cleared, the application will not log file operations in monitoring scopes when the task is not running.

The check box is selected by default.

b. Clear or select the [\*\*Block attempts to compromise the USN log\*\*](#)  check box.

The check box enables or disables protection of the USN log.

If the check box is selected, Kaspersky Embedded Systems Security will block attempts to delete the USN log or to compromise the USN log's content.

If the check box is cleared, the application will not monitor changes to the USN log.

The check box is selected by default.

c. Select or clear the [\*\*Apply Trusted Zone\*\*](#)  check box as applicable.

If the **Apply Trusted Zone** check box is selected, the **Exclusions** and **Trusted processes** configured in the **Trusted Zone** are applied to the monitoring scope in addition to the configured rule.

If the **Apply Trusted Zone** check box is cleared, the **Exclusions** and **Trusted processes** configured in the **Trusted Zone** are not applied to the monitoring scope.

By default, the check box is cleared.

5. On the **Schedule** and **Advanced** tabs, configure the task start [schedule](#).

6. Click **OK** to save the changes.

Kaspersky Embedded Systems Security immediately applies the new settings to the running task. Information about the date and time of settings modification are saved in the system audit log.

## Configuring monitoring rules

*To add a monitoring scope:*

1. In the Application Console tree, expand the **System Inspection** node.
2. Select the **File Integrity Monitor** child node.
3. Click the **File operations monitoring rules** link in the results pane of the **File Integrity Monitor** node.  
The **File operations monitoring** window opens.
4. Add a monitoring scope in one of the following ways:
  - If you want to select folders through the standard Microsoft Windows dialog:
    - a. On the left side of the window, click the **Browse** button.  
The standard Microsoft Windows **Browse for folder** window appears.
    - b. In the **Browse for folder** window, select the folder for which you want to monitor operations, and click the **OK** button.
    - c. Click the **Add** button to have Kaspersky Embedded Systems Security start monitoring file operations in the indicated monitoring scope.
  - If you want to specify a monitoring scope manually, add a path using a supported mask:
    - `<*.ext>` — all files with the extension `<ext>`, regardless of their location
    - `<*\name.ext>` — all files with name `<name>` and extension `<ext>`, regardless of their location
    - `<\dir\*>` — all files in folder `<\dir>`
    - `<\dir*\name.ext>` — all files with the name `<name>` and extension `<ext>` in folder `<\dir>` and all of its child folders

When specifying a monitoring scope manually, be sure that the path is in the following format: <volume letter>:\<mask>. If the volume letter is missing, Kaspersky Embedded Systems Security will not add the specified monitoring scope.

On the right side of the window, the **Rule description** tab displays the trusted users and file operation markers selected for this monitoring scope.

5. In the list of added monitoring scopes, select the scope settings that you want to configure.

6. Select the **Trusted users** tab.

7. Click the **Add** button.

The standard Microsoft Windows **Select Users or Groups** window appears.

8. Select the users or groups of users that Kaspersky Embedded Systems Security will consider trusted for the selected monitoring scope.

9. Click **OK**.

By default, Kaspersky Embedded Systems Security treats all [users not on the trusted user list as untrusted](#), and generates Critical events for them. For trusted users, statistics are compiled.

10. Select the **Set file operations markers** tab.

11. If required, perform the following actions to select several markers:

a. Select the **Detect file operations based on the following markers** option.

b. In the list of available [file operations](#) select the check boxes next to the operations you want to monitor.

By default, Kaspersky Embedded Systems Security detects all file operation markers, i.e. the **Detect file operations based on all recognizable markers** option is selected.

12. If you want to block all file operations for the selected area, select the **Detect and block all file operations in the selected area** check box.

13. If you want Kaspersky Embedded Systems Security to calculate a file checksum after an operation is performed, do the following:

a. In the **Checksum calculation** section, select the [Calculate checksum for a file final version, after the file was changed, if possible. The checksum will be available for viewing in the task log](#)  check box.

b. In the **Calculate the checksum using the algorithm** drop down list select one of the options:

- MD5 hash.
- SHA256 hash.

14. Add excluded monitoring scopes as applicable:

a. Select the **Set exclusions** tab.

b. Select the [Consider excluded monitoring scope](#)  check box.

c. Click the **Browse** button.

The standard Microsoft Windows **Browse for folder** window appears.

d. In the **Browse for folder** window, specify the folder that you want to exclude from the monitoring scope.

e. Click **OK**.

f. Click the **Add** button.

The specified folder is added to the list of excluded scopes.

You can also add excluded monitoring scopes manually using the same masks that are used to specify monitoring scopes.

15. Click the **Save** button to apply the new rule configuration.

The specified rule settings are immediately applied to the defined monitoring scope of the **File Integrity Monitor** task.

## Manage File Integrity Monitor via the Web Plug-in

In this section, learn how to configure the File Integrity Monitor task via the Web Plug-in.

### Configuring the File Integrity Monitor task

*To configure the File Integrity Monitor task via the Web Plug-in:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **System Inspection** section.
5. Click **Settings** in the **File Integrity Monitor** subsection.
6. In the **File Integrity Monitor** window that appears, on the **File operations monitoring settings** tab, configure the following settings:
  - a. Clear or select the [Log information about file operations that appear during the monitoring interruption period](#)  check box.

The check box enables or disables monitoring of the file operations specified in the File Integrity Monitor task settings when the task is not running for any reason (removal of a hard disk, task stopped by user, software error).

If the check box is selected, Kaspersky Embedded Systems Security will record events in all monitoring scopes when the File Integrity Monitor task is not running.

If the check box is cleared, the application will not log file operations in monitoring scopes when the task is not running.

The check box is selected by default.

- b. Clear or select the [Block attempts to compromise the USN log](#)  check box.

The check box enables or disables protection of the USN log.

If the check box is selected, Kaspersky Embedded Systems Security will block attempts to delete the USN log or to compromise the USN log's content.

If the check box is cleared, the application will not monitor changes to the USN log.

The check box is selected by default.

- c. Select or clear the [Apply Trusted Zone](#)  check box as applicable.

If the **Apply Trusted Zone** check box is selected, the **Exclusions** and **Trusted processes** configured in the **Trusted Zone** are applied to the monitoring scope in addition to the configured rule.

If the **Apply Trusted Zone** check box is cleared, the **Exclusions** and **Trusted processes** configured in the **Trusted Zone** are not applied to the monitoring scope.

By default, the check box is cleared.

7. On the **Task management** tab, configure the task start [schedule](#).

8. Click **OK** to save the changes.

Kaspersky Embedded Systems Security immediately applies the new settings to the running task. Information about the date and time of settings modification are saved in the system audit log.

## Configuring monitoring rules

*To add a monitoring scope:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **System Inspection** section.
5. Click **Settings** in the **File Integrity Monitor** subsection.
6. In the appeared **File Integrity Monitor** window, open the **File operations monitoring settings** tab.

7. In the **USN log** section, click the **Add** button.

The **File operations monitoring rule** window appears.

8. In the **Monitor file operations for the scope**, specify a path using a supported mask:

- `<*.ext>` - all files with the extension `<ext>`, regardless of their location
- `<*\name.ext>` - all files with name `<name>` and extension `<ext>`, regardless of their location
- `<\dir\*>` - all files in folder `<\dir>`
- `<\dir\*\name.ext>` - all files with the name `<name>` and extension `<ext>` in folder `<\dir>` and all of its child folders

When specifying a monitoring scope manually, be sure that the path is in the following format: `<volume letter>:\<mask>`. If the volume letter is missing, Kaspersky Embedded Systems Security will not add the specified monitoring scope.

9. On the **Trusted users** tab, do one of the following:

- Click the **Add** button and, in the window that opens, specify the user in the **User name** field using SID notation.
- Click the **Add from Administration Server** button and, in the window that appears on the screen, select the user from the list.

By default, Kaspersky Embedded Systems Security treats all users not on the [trusted user list as untrusted](#), and generates Critical events for them. For trusted users, statistics are compiled.

10. Click **OK**.

11. Select the **File operation markers** tab.

12. Perform the following actions to select several markers as applicable:

- a. Select the **Detect file operations based on the following markers** option.
- b. On the [list of available file operations](#) select the check boxes next to the operations you want to monitor.

By default Kaspersky Embedded Systems Security detects all file operation markers, the **Detect file operations based on all recognizable markers** option is selected.

13. If you want to block all file operations for the selected area, select the **Detect and block all file operations in the selected area** check box.

14. If you want Kaspersky Embedded Systems Security to calculate a file checksum after an operation is performed:

- a. Select the [Calculate checksum for the file if possible. The checksum will be available for viewing in the task report](#)  check box.
- b. In the **Checksum type** drop down list, select one of the options:

- SHA256 hash
- MD5 hash

15. If you do not want to monitor all file operations in the [list of available file operations](#), select the check boxes next to the operations you want to monitor.

16. Add excluded monitoring scopes as applicable:

a. Select the **Exclusions** tab.

b. Select the [Exclude the following folders from control](#) check box.

c. Click the **Add** button.

The **Select folder to add** window opens.

d. In the pane that opens on the right, specify the folder that you want to exclude from the monitoring scope.

e. Click **OK**.

The specified folder is added to the list of excluded scopes.

17. Click **OK** in the **File operations monitoring rule** window.

The specified rule settings are applied to the selected monitoring scope of the File Integrity Monitor task.

# AMSI Scanner

This section contains information about the AMSI scanner task and how to configure it.

## About the AMSI Scanner task

When the AMSI scanner task is running, Kaspersky Embedded Systems Security controls the execution of scripts created using Microsoft Windows scripting technologies (Active Scripting) such as VBScript or JScript®. The application can also process PowerShell™ scripts and scripts run in the Microsoft Office applications on operating systems with the Antimalware Scan Interface (AMSI) installed. You can allow or block execution of a script that has been found to be dangerous or probably dangerous. If Kaspersky Embedded Systems Security identifies a script as potentially dangerous, it blocks or allows execution of the script according to your selected action. If the **Block** action is selected, the application allows script execution only if a script has been found to be safe.

Starting from the Microsoft Windows 10 and Microsoft Windows Server 2016 operating system, Kaspersky Embedded Systems Security supports the Antimalware Scan Interface (AMSI). AMSI allows applications and services to integrate with any antimalware application installed on a device in order for all the executed scripts to be intercepted and scanned by the antimalware.

You can find more information about AMSI functionality on the [Microsoft Windows website](#).

You can [configure the AMSI scanner task settings](#).

## Default AMSI Scanner task settings

The AMSI scanner local system task uses the default settings described in the table below. You can change the values of these settings.

Default AMSI scanner task settings

Setting	Default value	Description
Action to perform on dangerous scripts	Block	You can specify the action to be performed on detection of probably dangerous scripts: block or allow their execution.
Heuristic analyzer	The <b>Medium</b> security level is applied.	The heuristic analyzer can be enabled or disabled. The analysis level can be configured.
Trusted zone	Used	General list of exclusions that can be used in selected tasks.

## Configuring AMSI Scanner task settings via the Administration Plug-in

*To configure an AMSI scanner task:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:

- To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
- To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Real-time server protection** section of the **Properties: <Policy name>** window, click **Settings** for **AMSI scanner**.
  5. In the **Action to perform on dangerous scripts** section on the **General** tab, do one of the following:
    - To allow execution of probably dangerous scripts, select **Allow**.
    - To block execution of probably dangerous scripts, select **Block**.
  6. In the **Heuristic analyzer** section, do one of the following:
    - Clear or select the **Use Heuristic Analyzer** check box.
    - If necessary, adjust the level of analysis using the [slider](#).
  7. In the **Trusted Zone** section, select or clear the **Apply Trusted Zone** check box.
  8. Click **OK**.
- The newly configured settings are applied.

## Configuring AMSI Scanner task settings via the Application Console

*To configure an AMSI scanner task:*

1. In the Application Console tree, expand the **Real-Time Computer Protection** node.
2. Select the **AMSI scanner** child node.
3. Click the **Properties** link in the results pane of the node.  
The **Task settings** window opens on the **General** tab.
4. In the **Action to perform on dangerous scripts** section, do one of the following:
  - To allow execution of probably dangerous scripts, select **Allow**.
  - To prohibit execution of probably dangerous scripts, select **Block**.
5. In the **Heuristic analyzer** section, do one of the following:
  - Clear or select the **Use Heuristic Analyzer** check box.
  - If necessary, adjust the level of analysis using the [slider](#).

6. In the **Trusted Zone** section, select or clear the **Apply Trusted Zone** check box.

7. Click **OK**.

The newly configured settings are applied.

## Configuring AMSI Scanner task settings via the Web Plug-in

*To configure an AMSI scanner task:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **Real-time server protection** section.
5. Click **Settings** in the **AMSI scanner** subsection.
6. In the **Action to perform on dangerous scripts** section on the **General** tab, do one of the following:
  - To allow execution of probably dangerous scripts, select **Allow**.
  - To block execution of probably dangerous scripts, select **Block**.
7. In the **Heuristic analyzer** section, do one of the following:
  - Clear or select the **Use Heuristic Analyzer** check box.
  - If necessary, adjust [the level of heuristic analysis](#) .
8. In the **Trusted Zone** section, select or clear the **Apply Trusted Zone** check box.
9. Click **OK**.

The newly configured settings are applied.

## AMSI Scanner task statistics

While the **AMSI scanner** task is running, you can view information about the number of scripts processed by Kaspersky Embedded Systems Security from the time when the task was started.

*To view the AMSI scanner task statistics:*

1. In the Application Console tree, expand the **Real-Time Computer Protection** node.
2. Select the **AMSI scanner** child node.

Current task statistics are displayed in the results pane of the node in the **Management** and **Statistics** sections.

You can view information about objects processed by Kaspersky Embedded Systems Security since the task was started (see the table below).

AMSI Scanner task statistics

Field	Description
<b>Scripts blocked</b>	Number of scripts blocked by Kaspersky Embedded Systems Security.
<b>Dangerous scripts detected</b>	Number of dangerous scripts detected.
<b>Probably dangerous scripts detected</b>	Number of probably dangerous scripts detected.
<b>Processed scripts</b>	Total number of processed scripts.

# Registry Access Monitor

This section explains how to start and configure the Registry Access Monitor task.

## About the Registry Access Monitor task

The Registry Access Monitor task is designed to track actions performed with the specified registry branches and keys in the monitoring scopes defined in the task settings. The task tracks actions within the operating system installed on the device or within the containers Windows Server 2016 and later defined in the monitoring scope. You can use the task to detect the changes indicating a security breach on the protected device.

To start the Registry Access Monitor task, you must configure at least one monitoring rule.

## About System registry monitoring rules

The **Registry Access Monitor** task is run based on the system registry monitoring rules. You can use the rule triggering criteria to configure the conditions triggering the task, and set the importance level for the detected events recorded in the task log.

A System registry monitoring rule is specified for each monitoring scope.

You can configure the following rule triggering criteria:

- **Actions**
- **Registry Values**
- **Trusted users**

### Actions

When the Registry Access Monitor task is started, Kaspersky Embedded Systems Security uses a list of actions to monitor the registry (see the table below).

If an action specified as a rule triggering criterion is detected, the application logs a respective event.

The importance level of the logged events does not depend on the selected actions or the number of events.

By default, Kaspersky Embedded Systems Security considers all actions. You can configure the list of actions manually in the task rule settings.

Actions

Action	Restrictions	Operating system
<b>Create key</b>	<ul style="list-style-type: none"><li>• For Windows XP and Windows Server 2003, if you add <b>Create key</b> to the list of</li></ul>	Windows XP and

	<p><b>Actions</b>, and then select the <b>Block operations according to the rules</b> mode, the key creation is not blocked in the specified operating systems because of the system restrictions. The key is created with a respective notification sent to the log of events.</p> <ul style="list-style-type: none"> <li>If you want to forbid creating a specific key via Registry Editor, create a rule for a parent registry key and make sure to add <b>Create subkeys</b> to the list of <b>Actions</b>, and then select the <b>Block operations according to the rules</b> mode.</li> </ul>	later
<b>Delete key</b>	If you want to delete a parent key, make sure to clear both the <b>Delete key</b> and <b>Delete subkeys</b> options on the list of monitored <b>Actions</b> for a configured registry key, as you can only delete the parent key with subkeys.	Windows XP and later
<b>Rename Key</b>	N/A	Windows XP and later
<b>Change key security settings</b>	N/A	Windows Vista and later
<b>Delete Values</b>	N/A	Windows XP and later
<b>Set values</b>	If you add <b>Set values</b> to the list of <b>Actions</b> , define the Default <b>Value name</b> in the rule for a key, and then select <b>Block operations according to the rules</b> mode, the key is not created, because a new key can only be created with a default value.	Windows XP and later
<b>Create subkeys</b>	N/A	Windows XP and later
<b>Delete subkeys</b>	N/A	Windows XP and later
<b>Rename subkeys</b>	N/A	Windows XP and later
<b>Change subkeys security settings</b>	N/A	Windows Vista and later

## Registry values

In addition to registry keys monitoring, you can block or monitor changes for the existing registry values. The following options are available:

- **Set value** - create the new registry values or change the existing registry values.
- **Delete value** - delete the existing registry values.

Renaming and changing the security settings are not applicable for the registry values.

## Trusted users

By default, the application treats all user actions as potential security breaches. The trusted user list is empty. You can configure the event importance level by creating a list of trusted users in the system registry monitoring rule settings.

*Untrusted user* is any user not indicated in the trusted user list in the monitoring scope rule settings. If Kaspersky Embedded Systems Security detects an action performed by an untrusted user, the Registry Access Monitor task records a Critical event in the task log.

*Trusted user* is a user or a group of users authorized to perform actions within the specified monitoring scope. If Kaspersky Embedded Systems Security detects an action performed by a trusted user, the Registry Access Monitor task records an Informational event in the task log.

## Default Registry Access Monitor task settings

The default settings for the Registry Access Monitor task are described in the table below. You can change the values of the settings in the following components:

- [The Administration Plug-in](#)
- [The Application Console](#)
- [The Web Plug-in](#)

Default Registry Access Monitor task settings

Setting	Default value	Description
<b>Monitoring scope</b>	Not defined	Use this option to define the parent registry keys and subkeys to monitor. The setting is mandatory. If you do not define the setting, the task fails to start. Monitoring events are generated for the parent registry keys and subkeys in the specified monitoring scope.
<b>Actions</b>	All items of the list of actions are selected	Use this option to configure a list of actions as applicable by selecting and clearing the respective check boxes.
<b>Registry Values</b>	Not defined	Use this option to add, modify, and remove the registry values you want to monitor for the defined monitoring scope.
<b>Trusted users</b>	Not defined	Use this option to specify users and groups of users authorized to perform the defined actions for the specified registry keys.
<b>Task mode</b>	Statistics only	You can select the task mode to <b>Block operations according to the rules</b> , or you can select the <b>Statistics only</b> mode to receive the notifications.
<b>Apply Trusted Zone</b>	Disabled	You can select or clear the <b>Apply Trusted Zone</b> check box to apply the <b>Trusted Zone</b> exclusions in addition to the configured for a rule.
Task start schedule	Not defined	You can configure the settings to start the task on schedule.

In this section, learn how to configure the Registry Access Monitor task via the Administration Plug-in.

## Configure the Registry Access Monitor task settings

To configure general Registry Access Monitor task settings:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **System inspection** section in the **Registry Access Monitor** subsection, click the **Settings** button. The **Registry Access Monitor** window appears.
5. On the **Registry Access Monitor Settings** tab, configure the following settings:
  - In the **Task mode** group, select the required option from the list:

- [Block operations according to the rules](#) 

If you select the **Block operations according to the rules** mode, Kaspersky Embedded Systems Security blocks the **Actions** defined for the monitoring scope. Also, if the **Apply Trusted Zone** check box is selected, Kaspersky Embedded Systems Security does not block the processes defined under **Trusted Zone**.

By default, the **Statistics only** mode is applied.

- [Statistics only](#) 

If the **Statistics only** mode is selected for the monitoring scope, Kaspersky Embedded Systems Security compiles the statistics for registry key actions according the configured rules. Also, if the **Apply Trusted Zone** check box is selected, Kaspersky Embedded Systems Security does not compile the statistics for processes defined under **Trusted Zone**.

By default, the **Statistics only** mode is applied.

- Select or clear the [Apply Trusted Zone](#)  check box as applicable.

If the **Apply Trusted Zone** check box is selected, the **Trusted processes** configured in the **Trusted Zone** are applied to the monitoring scope in addition to the configured rule.

If the **Apply Trusted Zone** check box is cleared, the **Trusted processes** configured in the **Trusted Zone** are not applied to the monitoring scope.

By default, the check box is cleared.

6. Add the [monitoring scopes](#) to be monitored by the task.
7. On the **Task management** tab, configure the [schedule](#) settings for a task.
8. Click **OK** to save the changes.

Kaspersky Embedded Systems Security immediately applies the new settings to the running task. Information about the date and time of settings modification are saved in the system audit log.

## Configuring monitoring rules

The monitoring rules are applied one after another in line with their position in the list of configured rules.

*To add a monitoring scope:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **System inspection** section, in the **Registry Access Monitor** subsection, click the **Settings** button.  
The **Registry Access Monitor** window appears.
5. In the **Monitor registry operations for the scope** section, click the **Add** button.
6. In the **Registry Access Monitoring Area** window, to add a monitor scope, specify a path using a [supported mask](#) .

You can use ? and \* as a mask when entering a path.

If you enter the path to a root registry key, make sure to specify full path without a mask, such as HKEY\_USERS. Following is a list of valid root registry keys:

- HKEY\_LOCAL\_MACHINE
- HKLM
- HKEY\_CURRENT\_USER
- HKCU
- HKEY\_USERS
- HKUS
- HKU
- HKEY\_CURRENT\_CONFIG
- HKEY\_CLASSES\_ROOT
- HKCR

Avoid using supported masks for the root keys when creating the rules.

If you specify only a root key, such as HKEY\_CURRENT\_USER, or a root key with a mask for all child keys, such as HKEY\_CURRENT\_USER\\*, a vast number of notifications about addressing the specified child keys is generated, which results in the system performance issues. If you specify a root key, such as HKEY\_CURRENT\_USER, or a root key with a mask for all child keys, such as HKEY\_CURRENT\_USER\\*, and select the **Block operations according to the rules** mode, the system is not able to read or change the keys required for OS functioning and fails to respond.

7. On the **Add** tab, configure the list of actions as applicable.

8. If you want to monitor certain **Registry Values**, do the following:

- On the **Registry Values** tab, click the **Add** button.
- In the **Registry value rule** window, enter the **Controlled operations** and set the **Controlled operations**.
- Click **OK** to save the changes.

9. If you want to define **Trusted users**, do the following:

- On the **Trusted users** tab, click the **Add** button.
- In the **Select Users or Groups** window, select the users or groups of users authorized to perform the defined actions.
- Click **OK** to save the changes.

By default, Kaspersky Embedded Systems Security treats all users not on the [trusted user list as untrusted](#), and generates Critical events for them. For trusted users, statistics are compiled.

10. Click **OK** in the **Registry Access Monitoring Area** window.

The specified rule settings are immediately applied to the defined monitoring scope of the **Registry Access Monitor** task.

## Managing the Registry Access Monitor via the Administration Console

In this section, learn how to configure the Registry Access Monitor task via the Application Console.

### Configuring the Registry Access Monitor task settings

*To configure general Registry Access Monitor task settings:*

1. In the Application Console tree, expand the **System Inspection** node.
2. Select the **Registry Access Monitor** child node.
3. Click the **Properties** link in the results pane of the **Registry Access Monitor** node.  
The **Task settings** window appears.
4. In the **Task settings** window, on the **General** tab, configure the following settings:
  - In the **Task mode** group, select the required option from the list:

- [Block operations according to the rules](#) 

If you select the **Block operations according to the rules** mode, Kaspersky Embedded Systems Security blocks the **Actions** defined for the monitoring scope. Also, if the **Apply Trusted Zone** check box is selected, Kaspersky Embedded Systems Security does not block the processes defined under **Trusted Zone**.

By default, the **Statistics only** mode is applied.

- [Statistics only](#) 

If the **Statistics only** mode is selected for the monitoring scope, Kaspersky Embedded Systems Security compiles the statistics for registry key actions according the configured rules. Also, if the **Apply Trusted Zone** check box is selected, Kaspersky Embedded Systems Security does not compile the statistics for processes defined under **Trusted Zone**.

By default, the **Statistics only** mode is applied.

- Select or clear the [Apply Trusted Zone](#)  check box as applicable.

If the **Apply Trusted Zone** check box is selected, the **Trusted processes** configured in the **Trusted Zone** are applied to the monitoring scope in addition to the configured rule.

If the **Apply Trusted Zone** check box is cleared, the **Trusted processes** configured in the **Trusted Zone** are not applied to the monitoring scope.

By default, the check box is cleared.

5. On the **Schedule** and **Advanced** tabs, configure the task start [schedule](#).

6. Click **OK** to save the changes.

Kaspersky Embedded Systems Security immediately applies the new settings to the running task. Information about the date and time of settings modification are saved in the system audit log.

## Configuring monitoring rules

The monitoring rules are applied one after another in line with their position in the list of configured rules.

*To add a monitoring scope:*

1. In the Application Console tree, expand the **System Inspection** node.
2. Select the **Registry Access Monitor** child node.
3. Click the **Registry Access Monitoring Rules** link in the results pane of the **Registry Access Monitor** node.  
The **Registry Access Monitoring** window appears.
4. In the **Registry Access Monitoring** window, specify a path using a supported mask to **Add system registry key to monitor** and click the **Add** button.

Avoid using supported masks for the root keys, when creating the rules.

If you specify only a root key, such as HKEY\_CURRENT\_USER, or a root key with a mask for all child keys, such as HKEY\_CURRENT\_USER\\*, a vast number of notifications about addressing the specified child keys is generated, which results in the system performance issues.

If you specify a root key, such as HKEY\_CURRENT\_USER, or a root key with a mask for all child keys, such as HKEY\_CURRENT\_USER\\*, and select the **Block operations according to the rules** mode, the system is not able to read or change the keys required for OS functioning and fails to respond.

5. On the **Actions** tab for the selected monitoring area, configure the list of actions as applicable.

6. If you want to monitor certain **Registry Values**, do the following:

- a. On the **Registry Values** tab, click the **Add** button.
- b. In the **Registry value rule** window, enter the **Controlled operations** and set the required **Controlled operations**.
- c. Click **OK** to save the changes.

7. If you want to define **Trusted users**, do the following:

- a. On the **Trusted users** tab, click the **Add** button.
- b. In the **Select Users or Groups** window, select the users or groups of users authorized to perform the defined actions.
- c. Click **OK** to save the changes.

By default, Kaspersky Embedded Systems Security treats all users not on the [trusted user list as untrusted](#), and generates Critical events for them. For trusted users, statistics are compiled.

8. Click **Save** in the **Registry Access Monitoring Area** window.

The specified rule settings are immediately applied to the defined monitoring scope of the **Registry Access Monitor** task.

## Managing the Registry Access Monitor via the Web Plug-in

In this section, learn how to configure the Registry Access Monitor task via the Web Plug-in.

### Configuring the Registry Access Monitor task

*To configure the Registry Access Monitor task via the Web Plug-in:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **System Inspection** section.
5. Click **Settings** in the **Registry Access Monitor** subsection.
6. In the **Registry Access Monitor** window, on the **Registry Access Monitor Settings** tab, configure the following settings:
  - In the **Task mode** group, select the required option from the list:
    - [Block operations according to the rules](#) 

If you select the **Block operations according to the rules** mode, Kaspersky Embedded Systems Security blocks the **Actions** defined for the monitoring scope. Also, if the **Apply Trusted Zone** check box is selected, Kaspersky Embedded Systems Security does not block the processes defined under **Trusted Zone**.

By default, the **Statistics only** mode is applied.

- [Statistics only](#) 

If the **Statistics only** mode is selected for the monitoring scope, Kaspersky Embedded Systems Security compiles the statistics for registry key actions according the configured rules. Also, if the **Apply Trusted Zone** check box is selected, Kaspersky Embedded Systems Security does not compile the statistics for processes defined under **Trusted Zone**.

By default, the **Statistics only** mode is applied.

- Select or clear the [Apply Trusted Zone](#)  check box as applicable.

If the **Apply Trusted Zone** check box is selected, the **Trusted processes** configured in the **Trusted Zone** are applied to the monitoring scope in addition to the configured rule.

If the **Apply Trusted Zone** check box is cleared, the **Trusted processes** configured in the **Trusted Zone** are not applied to the monitoring scope.

By default, the check box is cleared.

7. On the **Task management** tab, configure the task start [schedule](#).

8. Click **OK** to save the changes.

Kaspersky Embedded Systems Security immediately applies the new settings to the running task. Information about the date and time of settings modification are saved in the system audit log.

## Configuring monitoring rules

The monitoring rules are applied one after another in line with their position in the list of configured rules.

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **System Inspection** section.
5. Click **Settings** in the **Registry Access Monitor** subsection.
6. In the **Registry Access Monitor** window that appears on the screen, open the **Registry Access Monitor Settings** tab.
7. In the **Registry Access Monitoring Rules** section, click the **Add** button.
8. In the **Registry Access Monitoring Area** window, specify a path using a [supported mask](#)  to **Monitor registry operations for the scope**.

You can use ? and \* as a mask when entering a path.

If you enter the path to a root registry key, make sure to specify full path without a mask, such as HKEY\_USERS. Following is a list of valid root registry keys:

- HKEY\_LOCAL\_MACHINE
- HKLM
- HKEY\_CURRENT\_USER
- HKCU
- HKEY\_USERS
- HKUS
- HKU
- HKEY\_CURRENT\_CONFIG
- HKEY\_CLASSES\_ROOT
- HKCR

Avoid using supported masks for the root keys, when creating the rules.

If you specify only a root key, such as HKEY\_CURRENT\_USER, or a root key with a mask for all child keys, such as HKEY\_CURRENT\_USER\\*, a vast number of notifications about addressing the specified child keys is generated, which results in the system performance issues.

If you specify a root key, such as HKEY\_CURRENT\_USER, or a root key with a mask for all child keys, such as HKEY\_CURRENT\_USER\\*, and select the **Block operations according to the rules** mode, the system is not able to read or change the keys required for OS functioning and fails to respond.

9. On the **Actions** tab for the selected monitoring area, configure the list of actions as applicable.

10. If you want to monitor certain **Registry Values**, do the following:

- a. On the **Registry Values** tab, click the **Add** button.
- b. In the **Registry value rule** window, enter the **Value mask** and set the required **List of operations**.
- c. Click **OK** to save the changes.

11. If you want to define **Trusted users**, do the following:

- a. On the **Trusted users** tab, click the **Add** button.
- b. Enter the **User name** or click **Set SID Everyone**, to define users authorized to perform the selected actions.
- c. Click **OK** to save the changes.

By default, Kaspersky Embedded Systems Security treats all users not on the [trusted user list as untrusted](#), and generates Critical events for them. For trusted users, statistics are compiled.

12. Click **OK** in the **Registry Access Monitoring Area** window to save the changes.

The specified rule settings are immediately applied to the defined monitoring scope of the **Registry Access Monitor** task.

# Log Inspection

This section contains information about the Log Inspection task and task settings.

## About the Log Inspection task

When the Log Inspection task runs, Kaspersky Embedded Systems Security monitors the integrity of the protected environment based on the results of an inspection of Windows event logs. The application notifies the administrator upon detecting abnormal behavior that may indicate attempted cyberattacks.

Kaspersky Embedded Systems Security analyzes the Windows event logs and identifies breaches based on the rules specified by the user or by the settings of the heuristic analyzer, which the task uses to inspect logs.

## Predefined rules and heuristic analysis

You can use the Log Inspection task to monitor the state of the protected system by applying predefined rules based on existing heuristics. The heuristic analyzer identifies abnormal activity on the protected device, which may be evidence of an attempted attack. Templates to identify abnormal behavior are included in the available rules in the predefined rules settings.

Seven rules are included in the rule list for the Log Inspection task. You can enable or disable any of the rules. You cannot delete existing rules or create new rules.

You can configure the triggering criteria for rules that monitor events for the following operations:

- Password brute-force detection
- Network login detection

You can also configure exclusions in the task settings. The heuristic analyzer is not activated when a login is conducted by a trusted user or from a trusted IP address.

Kaspersky Embedded Systems Security does not use heuristics to inspect Windows logs if the heuristic analyzer is not used by the task. By default, the heuristic analyzer is enabled.

When the rules are applied, the application records a *Critical event* in the Log Inspection task log.

## Custom rules for the Log Inspection task

You can use the rule settings to specify and change the criteria for triggering rules upon detecting the selected events in the specified Windows log. By default, the list of Log Inspection rules has four rules. You can enable and disable these rules, remove rules, and edit rule settings.

You can configure the following rule triggering criteria for each rule:

- List of record identifiers in the Windows Event Log.  
The rule is triggered when a new record is created in the Windows Event Log, if the event properties includes an event identifier specified in the rule. You can also add and remove identifiers for each specified rule.

- Event source.

For each rule, you can specify a log within the Windows Event Log. The application will search for records with the specified event identifiers only in this log. You can select one of the standard logs (Application, Security, or System), or specify a custom log by entering the name in the source selection field.

The application does not verify that the specified log actually exists in the Windows Event Log.

When the rule is triggered, Kaspersky Embedded Systems Security records a Critical event in the Log Inspection task log.

By default, the Log Inspection task applies custom rules.

Before starting the Log Inspection task make sure the system audit policy is set up correctly. Refer to the [Microsoft article](#) for details.

## Default Log Inspection task settings

By default, the Log Inspection task has the settings described in the table below. You can change the values of these settings.

Default Log Inspection task settings

Setting	Default value	Description
<b>Apply custom rules for log inspection</b>	Not applied.	You can enable, disable, add, or modify the custom rules.
<b>Apply predefined rules for log inspection</b>	Applied.	You can enable or disable the heuristic analyzer, which detects abnormal activity on the protected device.
<b>Brute-force attack detection</b>	10 logon failures per 300 seconds.	You can set the number of attempts and time frame used, which will be considered as triggers by the heuristic analyzer.
<b>Network logon</b>	12:00:00 AM.	You can indicate the start and end of the time interval during which Kaspersky Embedded Systems Security treats sign-in attempts as abnormal activity.
<b>Exclusions</b>	Not applied.	You can specify users and IP addresses which will not trigger the heuristic analyzer.
Task start schedule	First run is not scheduled.	You can configure settings to start the task on a schedule.

## Managing Log Inspection rules via the Administration Plug-in

In this section, learn how to add and configure Log Inspection rules via the Administration Plug-in.

## Configuring predefined task rules

Perform the following actions to configure the predefined rules for the Log Inspection task:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **System inspection** section, click the **Settings** button in the **Log Inspection** subsection.  
The **Log Inspection** window opens.
5. Select the **Predefined rules** tab.
6. Select or clear the [Apply predefined rules for log inspection](#)  check box.

For the task to run, at least one Log Inspection rule must be selected.

7. Select the rules you want to apply from the list of predefined rules:
  - There are patterns of a possible brute-force attack in the system.
  - There are patterns of a possible Windows Event log abuse.
  - Atypical actions detected on behalf of a new service installed.
  - Atypical logon that uses explicit credentials detected.
  - There are patterns of a possible Kerberos forged PAC (MS14-068) attack in the system.
  - Atypical actions detected directed at a privileged built-in group Administrators.
  - There is an atypical activity detected during a network logon session.
8. To configure the selected rules, click the **Advanced settings** button.  
The **Log Inspection** window opens.
9. In the **Brute-force attack detection** section, set the number of attempts and time frame used as triggers by the heuristic analyzer.

10. In the **Network logon detection** section, indicate the start and end of the time interval during which Kaspersky Embedded Systems Security treats sign-in attempts as abnormal activity.
11. Select the **Exclusions** tab.
12. Perform the following actions to add trusted users:
  - a. Click the **Browse** button.
  - b. Select a user.
  - c. Click **OK**.

The selected user is added to the list of trusted users.
13. Perform the following actions to add trusted IP addresses:
  - a. Enter the IP address.
  - b. Click the **Add** button.
14. The entered IP address is added to the list of trusted IP addresses.
15. On the **Task management** tab, configure the [task start schedule](#).
16. Click **OK** in the **Log Inspection** window.

The Log Inspection task configuration is saved.

## Adding Log Inspection rules via the Administration Plug-in

*Perform the following actions to add and configure a new custom Log Inspection rule:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
  - To configure application settings for a group of protected devices, select the **Policies** tab and open the [Properties: <Policy name>](#) window.
  - To configure the application for a single protected device, select the **Devices** tab and open the [Application settings](#) window.

If an active Kaspersky Security Center policy is applied to a device and blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **System inspection** section, click the **Settings** button in the **Log Inspection** subsection.

The **Log Inspection** window opens.
5. On the **Custom rules** tab, select or clear the [Apply custom rules for log inspection](#)  check box.

You can control whether the preset rules are applied for Log Inspection. Select the check boxes corresponding to the rules you want to apply for Log Inspection.

6. To add a new custom rule, click the **Add** button.

The **Custom log inspection rule** window opens.

7. In the **General** section specify the following information about the new rule:

- **Rule name**
- **The rule is triggered when new entries appear in the Windows event log if the specified identifier (ID) is found in the event parameters**

8. In the **Triggering criteria** section, specify the event IDs that will trigger the rule:

a. Enter an ID.

b. Click the **Add** button.

The entered event ID is added to the list. You can add an unlimited number of identifiers to each rule.

9. Click **OK**.

The Log Inspection rule is added to the list of rules.

## Managing Log Inspection rules via the Application Console

In this section, learn how to add and configure Log Inspection rules via the Application Console.

### Configuring predefined task rules

*Perform the following actions to configure the heuristic analyzer for the Log Inspection task:*

1. In the Application Console tree, expand the **System Inspection** node.

2. Select the **Log Inspection** child node.

3. Click the **Properties** link in the results pane of the **Log Inspection** node.

The **Task settings** window opens.

4. Select the **Predefined rules** tab.

5. Select or clear the **Apply predefined rules for log inspection** check box.

For the task to run, at least one Log Inspection rule must be selected.

6. Select the rules you want to apply from the list of predefined rules:

- There are patterns of a possible brute-force attack in the system.
  - There are patterns of a possible Windows Event log abuse.
  - Atypical actions detected on behalf of a new service installed.
  - Atypical logon that uses explicit credentials detected.
  - There are patterns of a possible Kerberos forged PAC (MS14-068) attack in the system.
  - Atypical actions detected directed at a privileged built-in group Administrators.
  - There is an atypical activity detected during a network logon session.
7. To configure the selected rules, go to the **Extended** tab.
  8. In the **Brute-force attack detection** section, set the number of attempts and time frame used as triggers by the heuristic analyzer.
  9. In the **Network logon** section, indicate the start and end of the time interval during which Kaspersky Embedded Systems Security treats sign-in attempts as abnormal activity.
  10. Select the **Exclusions** tab.
  11. Perform the following actions to add trusted users:
    - a. Click the **Browse** button.
    - b. Select a user.
    - c. Click **OK**.

The selected user is added to the list of trusted users.
  12. Perform the following actions to add trusted IP addresses:
    - a. Enter the IP address.
    - b. Click the **Add** button.

The entered IP address is added to the list of trusted IP addresses.
  13. Select the **Schedule** and **Advanced** tabs to configure the task start schedule.
  14. Click **OK** in the **Task settings** window.

The Log Inspection task configuration is saved.

## Adding Log Inspection rules via the Application Console

*To add and configure a new custom Log Inspection rule:*

1. In the Application Console tree, expand the **System Inspection** node.
2. Select the **Log Inspection** child node.

3. In the results pane of the **Log Inspection** node, click the **Log inspection rules** link.
4. The **Log inspection rules** window opens.
5. Select or clear the **Apply custom rules for log inspection. The rules configured are not applied until the checkbox is selected**  check box.

You can control whether the predefined rules are applied to the Log Inspection task. Select the check boxes corresponding to the rules you want to apply to Log Inspection.

6. To create a new custom rule:
  - a. Enter the name of the new rule.
  - b. Click the **Add** button.

The created rule is added to the general rule list.
7. To configure any rule:
  - a. Select a rule from the list.

In the right area of the window, the **Description** tab displays general information about the rule.

The description for the new rule is blank.

- b. Select the **Rule description** tab.
8. In the **General** section specify the following information about the new rule:
  - **Rule name**
  - **Log name** 
  - **The rule is triggered when new entries appear in the Windows event log if the specified identifier (ID) is found in the event parameters** 
9. In the **Event identifiers** section specify the event IDs that will trigger the rule:
  - a. Enter an event ID.
  - b. Click the **Add** button.

The entered event ID is added to the list. You can add an unlimited number of identifiers to each rule.
10. Click the **Save** button.

The configured log inspection rules will be applied.

## Managing Log Inspection rules via the Web Plug-in

*To add and configure Log Inspection rules via the Web Plug-in:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the <Policy name> window that opens select the **Application settings** tab.
4. Select the **System Inspection** section.
5. Click **Settings** in the **Log Inspection** subsection.
6. Configure the settings described in the table below.

Log Inspection task settings

Setting	Description
<b>Apply custom rules for log inspection</b>	You can enable, disable, add, or modify the custom rules. The setting is available on the table is with the list of custom rules.
<b>Apply predefined rules for log inspection</b>	You can enable or disable the heuristic analyzer, which detects abnormal activity on the protected device. The setting is available on the table is with the list of custom rules.
<b>Detect brute-force attack if an incorrect password is entered with a frequency defined</b>	You can set the number of attempts and time frame used, which will be considered as triggers by the heuristic analyzer.
<b>Detect network logon, if logged on within a period defined</b>	You can indicate the start and end of the time interval during which Kaspersky Embedded Systems Security treats sign-in attempts as abnormal activity.
<b>Users Exclusions</b>	You can specify users which will not trigger the heuristic analyzer.
<b>Excluded IP Addresses</b>	You can specify IP addresses which will not trigger the heuristic analyzer.
<b>Task management</b>	You can configure settings to start the task on a schedule.

# On-Demand Scan

This section provides information about On-Demand Scan tasks, and instructions on configuring On-Demand Scan task settings and security settings on the protected device.

## About On-Demand Scan tasks

Kaspersky Embedded Systems Security scans the specified area for viruses and other computer security threats. Kaspersky Embedded Systems Security scans protected device files, RAM, and autorun objects.

Kaspersky Embedded Systems Security provides the following On-Demand Scan tasks:

- The Scan at Operating System Startup task is performed every time Kaspersky Embedded Systems Security starts. Kaspersky Embedded Systems Security scans boot sectors and master boot records of hard drives, removable drives, system memory, and process memory. Every time Kaspersky Embedded Systems Security runs the task, it creates a copy of non-infected boot sectors. If it detects a threat in those sectors the next time the task starts, it replaces them with the backup copy.

The Scan at Operating System startup task is created automatically after installation. By default, the Notify only mode is applied. In this case, after you deploy Kaspersky Embedded Systems Security on the devices, you can enable the Scan at Operating System startup task if no issues with system services were discovered during scan. If the application detects critical system services as infected or probably infected objects, the Notify only mode gives you time to figure out the reason and solve the issue. If the application applies the Perform recommended action mode, which calls the Disinfect. Remove if disinfection fails action, disinfection or removal of the system files may result in critical issues with the operating system startup.

The Scan at Operating System Startup task might not be performed if a protected device wakes up after either sleep or hibernate mode. The task is performed only at protected device restart or start up after complete shut down.

- By default, the Critical Areas Scan task is performed weekly on a schedule. Kaspersky Embedded Systems Security scans objects in critical areas of the operating system: autorun objects, boot sectors and master boot records of hard drives and removable drives, system memory and process memory. The application scans files in system folders, for example, %windir%\system32. Kaspersky Embedded Systems Security applies security settings that correspond to the [Recommended level](#). You can modify the settings of the Critical Areas Scan task.
- The Quarantine Scan task is executed by default according to a schedule after every database update. The Quarantine Scan task scope cannot be modified.
- The Application Integrity Control task is performed daily. It provides the option of checking Kaspersky Embedded Systems Security modules for damage or modification. The application installation folder is checked. The task execution statistics indicate the number of modules checked and the number of modules found to be corrupted. The values of the task settings are defined by default and cannot be edited. The task start schedule settings can be edited.

Additionally, you can create custom On-Demand Scan tasks, for example, a task for scanning shared folders on the protected device.

Kaspersky Embedded Systems Security may run several On-Demand Scan tasks at the same time.

## About the task scan scope and security settings

In the Application Console, the scan scope of the selected On-Demand task is displayed as a tree or in the list of the protected device file resources that Kaspersky Embedded Systems Security can control. By default, the network file resources of the protected device are displayed in a list-view mode.

In the Administration Plug-in only the list view is available.

*To display network file resources in the tree-view mode in the Application Console,*

open the drop down list in the **Scan scope settings** window upper left sector and select **Tree-view**.

The items or nodes are displayed in a list-view or in a tree-view mode of the protected device file resources as follows:

- The node is included in the scan scope.
- The node is excluded from the scan scope.
- At least one of the child nodes of this node is excluded from the scan scope, or the security settings of the child node(s) differ(s) from the setting of a parental node (for a tree-view mode only).

The  icon is displayed if all child nodes are selected, but the parent node is not selected. In this case, changes in the composition of files and folders of the parent node are disregarded automatically when the scan scope for the selected child node is being created.

Using the Application Console, you can also [add virtual drives](#) to the scan scope. The names of the virtual nodes are displayed in blue font.

## Security settings

In the selected On-Demand task, the default security settings can be modified by configuring them as common settings for the entire protection or scan scope, or as different settings for different nodes or items in the device's file resource tree or list.

Security settings configured for the selected parent node are automatically applied to all child nodes. The security settings of the parent node are not applied to child nodes that are configured separately.

The settings for a selected scan scope or protection scope can be configured using one of the following methods:

- Select one of three predefined security levels (**Maximum performance**, **Recommended**, or **Maximum protection**).
- Manually change the security settings for the selected nodes or items in the tree or list of the protected device's file resources (the security level changes to **Custom**).

A set of node settings can be saved in a template in order to be applied later to other nodes.

## Predefined scan scopes

The tree or list of protected device file resources for the selected On-Demand Scan task is displayed in the **Scan scope settings** window.

The file resource tree or list displays the nodes to which you have read-access based on the configured Microsoft Windows security settings.

Kaspersky Embedded Systems Security contains the following predefined scan scopes:

- **My Computer.** Kaspersky Embedded Systems Security scans the entire protected device.
- **Local hard drives.** Kaspersky Embedded Systems Security scans objects on a protected device hard drives. All hard drives, individual disks, folders or files can be included in or excluded from the scan scope.
- **Removable drives.** Kaspersky Embedded Systems Security scans files on external devices, such as CDs or removable drives. All removable drives, individual disks, folders or files can be included in or excluded from the scan scope.
- **Network.** Network folders or files can be added to the scan scope by specifying their path in UNC (Universal Naming Convention) format. The account used to start the task must have permissions to access the added network folders and files. By default, On-Demand Scan tasks run under the system account.

Connected network drives will also not be displayed in the protected device's file resource tree. To include objects on network drives in the scan scope, specify the path to the folder that corresponds to the network drive in UNC format.

- **System memory.** Kaspersky Embedded Systems Security scans the executable files and modules of the processes running in the operating system when the scan is initiated.
- **Startup objects.** Kaspersky Embedded Systems Security scans objects referred to by registry keys and configuration files, for example WIN.INI or SYSTEM.INI, as well as the application's modules that are started automatically at protected device startup.
- **Shared folders.** You can include shared folders on the protected device in the scan scope.
- **Virtual drives.** Virtual folders, files, and drives connected to the protected device can be included in the scan scope, for example, common cluster drives.

Virtual drives created using a SUBST command are not displayed in the protected device's file resource tree in the Application Console. In order to scan objects on a virtual drive, include the protected device folder associated with the virtual drive in the scan scope.

By default, you can view and configure predefined scan scopes in the network file resource tree; you can also add predefined scopes to the network file resource list during its formation in the scan scope settings.

By default, On-Demand Scan tasks are run under the following scopes:

- Scan at Operating System Startup task:
  - **Local hard drives**
  - **Removable drives**
  - **System memory**
- Critical Areas Scan:

- **Local hard drives** (excluding Windows folders)
- **Removable drives**
- **System memory**
- **Startup objects**
- Other tasks:
  - **Local hard drives** (excluding Windows folders)
  - **Removable drives**
  - **System memory**
  - **Startup objects**
  - **Shared folders**

## Online storage file scanning

### About cloud files

Kaspersky Embedded Systems Security can interact with Microsoft OneDrive cloud files. The application supports the new OneDrive Files On-Demand feature.

Kaspersky Embedded Systems Security does not support other online storages.

OneDrive Files On-Demand helps you access all your OneDrive files without having to download all of them and use storage space on your device. You can download files to your hard drive when you need to.

When the OneDrive Files On-Demand feature is on, you see status icons next to each file in the **Status** column in File Explorer. Each file has one of the following statuses:

🔗 This status icon indicates that the file is *only available online*. Online-only files are not physically stored on your hard drive. You can't open online-only files when your device is not connected to the Internet.

📁 This status icon indicates that a file is *locally available*. This happens when you open an online-only file and it downloads to your device. You can open a locally available file anytime, even without Internet access. To clear up space you can change the file back to 🔗 online-only.

📁 This status icon indicates that a file is *stored on your hard drive and is always available*.

### Cloud file scanning

Kaspersky Embedded Systems Security can only scan cloud files that are stored locally on a protected device. Such OneDrive files have the 📁 and 📁 statuses. The 🔗 files are skipped during scanning, since they are not physically located on the protected device.

Kaspersky Embedded Systems Security does not automatically download ☁ files from the cloud during the scanning, even if they are included in the scan scope.

Cloud files are processed by several Kaspersky Embedded Systems Security tasks in various scenarios depending on the task type:

- Real-time cloud file scanning: you can add folders containing cloud files to the Real-Time File Protection task protection scope. A file is scanned when it is accessed by the user. If a ☁ file is accessed by the user, it is downloaded, becomes locally available, and its status changes to 🟢. This allows the file to be processed by the Real-Time File Protection task.
- On-demand cloud file scanning: you can add folders containing cloud files to the On-Demand Scan task's scan scope. The task scans files with the 🟢 and 🟡 statuses. If any ☁ files are found in the scope, they will be skipped during scanning and an informational event will be recorded in the task log, indicating that the scanned file is only a placeholder for a cloud file and does not exist on a local drive.
- Application Control rule generation and usage: you can create allowing and denying rules for 🟢 and 🟡 files using the Rule Generator for Applications Launch Control task. The Applications Launch Control task applies the Default Deny principle and created rules to process and block cloud files.

The Applications Launch Control task blocks the start of all cloud files, irrespective of their status. The ☁ files are not included in the rule generation scope by the application, as they are not physically stored on your hard drive. Since allowing rules cannot be created for such files, they are subject to the Default Deny principle.

When a threat is detected in a OneDrive cloud file, the application applies the action specified in the settings of the task performing the scanning. Thus, the file may be removed, disinfected, moved to quarantine, or backed up.

Changes to local files are synchronized with the copies stored on OneDrive in accordance with the principles outlined in the relevant Microsoft OneDrive documentation.

## About predefined security levels

The **Use iChecker technology**, **Use iSwift technology**, **Use heuristic analyzer**, and **Check Microsoft signature in files** security settings are not included in the settings for the preset security levels. If the **Use iChecker technology**, **Use iSwift technology**, **Use heuristic analyzer**, and **Check Microsoft signature in files** settings change, the preset security level you have selected will not change.

You can apply one of the following three predefined security levels to a node selected in the device's file resource tree: **Maximum performance**, **Recommended**, or **Maximum protection**. Each of these levels contains its own predefined security settings (see the table below).

### Maximum performance

The **Maximum performance** security level is recommended if your network has additional protected device security measures, for example, firewalls and existing security policies, beyond using Kaspersky Embedded Systems Security on protected devices.

## Recommended

The **Recommended** security level ensures the best combination of protection and performance impact on devices. Kaspersky experts recommend this level as adequate to protect devices on most corporate networks. The **Recommended** security level is set by default.

## Maximum protection

The **Maximum protection** security level is recommended if your organization's network has elevated device security requirements.

Predefined security levels and corresponding security setting values

Options	Security level		
	Maximum performance	Recommended	Maximum protection
Scan objects	By format	All objects	All objects
Scan only new and modified files	Enabled	Disabled	Disabled
Action to perform on infected and other objects	Disinfect. Remove if disinfection fails	Perform recommended action (Disinfect. Remove if disinfection fails)	Disinfect. Remove if disinfection fails
Action to perform on probably infected objects	Quarantine	Perform recommended action (Quarantine)	Quarantine
Exclude files	No	No	No
Do not detect	No	No	No
Stop scanning if it takes longer than (sec.)	60 sec.	No	No
Do not scan compound objects larger than (MB)	8 MB	No	No
Scan alternate NTFS streams	Yes	Yes	Yes
Scan disk boot sectors and MBR	Yes	Yes	Yes
Scan of compound objects	<ul style="list-style-type: none"> <li>SFX archives*</li> <li>Packed objects*</li> <li>Embedded OLE objects*</li> </ul> <p>* New and modified objects only</p>	<ul style="list-style-type: none"> <li>SFX archives*</li> <li>Packed objects*</li> <li>Embedded OLE objects*</li> </ul> <p>* All objects</p>	<ul style="list-style-type: none"> <li>Archives*</li> <li>SFX archives*</li> <li>Email databases*</li> <li>Plain mail*</li> <li>Packed objects*</li> <li>Embedded OLE objects*</li> </ul>

## About the Removable Drives Scan

You can configure scanning of removable drives connected to the protected device via a USB port.

Kaspersky Embedded Systems Security scans a removable drive using the On-Demand Scan task. The application automatically creates a new On-Demand Scan task when the removable drive is connected and deletes the task after the scanning is completed. The created task is performed with the predefined security level defined for removable drive scanning. You cannot configure the settings of the temporary On-Demand Scan task.

If you installed Kaspersky Embedded Systems Security without anti-virus databases, the removable drives scan will be unavailable.

Kaspersky Embedded Systems Security scans connected removable drives when they are registered as USB external devices in the operating system. The application does not scan a removable drive if the connection is blocked by the Device Control task. The application does not scan MTP-connected mobile devices.

Kaspersky Embedded Systems Security allows access to removable drives during scanning.

Scan results for each removable drive are available in the log for the On-Demand Scan task created when the removable drive is connected.

You can change the settings of the Removable Drives Scan component (see the table below).

Removable Drives Scan settings

Setting	Default value	Description
<b>Scan removable drives on connection via USB</b>	Check box is cleared	You can turn on or turn off scanning of removable drive upon connection to the protected device via USB.
<b>Scan removable drives if its stored data volume does not exceed (MB)</b>	8192 MB	You can reduce the component's scope by setting the maximum volume of data on the scanned drive. Kaspersky Embedded Systems Security does not scan a removable drive if the volume of stored data exceeds the specified value.
<b>Scan with security level</b>	Maximum protection	You can configure created On-Demand Scan tasks by selecting one of three security levels: <ul style="list-style-type: none"> <li>• <b>Maximum protection</b></li> <li>• <b>Recommended</b></li> <li>• <b>Maximum performance</b> The algorithm used when infected, probably infected, and other objects are detected, as well as the other scan settings for each security level, correspond to the predefined security levels in the On-Demand Scan tasks.</li> </ul>

## About the Baseline File Integrity Monitor task

During the Baseline File Integrity Monitor task, Kaspersky Embedded Systems Security does not check locked files, folders, file shortcuts and cloud files.

The Baseline File Integrity Monitor task monitors the integrity of files in the monitoring scope by comparing the files' hash (MD5 hash or SHA256 hash) to a baseline.

On the first Baseline File Integrity Monitor task run, Kaspersky Embedded Systems Security creates a baseline by calculating and storing hash for files in the task's monitoring scope. If a Baseline File Integrity Monitor task monitoring scope was changed, Kaspersky Embedded Systems Security updates the baseline on the next Baseline File Integrity Monitor task run by calculating and storing hash for files in the task's monitoring scope. If a Baseline File Integrity Monitor task was deleted, Kaspersky Embedded Systems Security deletes the baseline for this Baseline File Integrity Monitor task.

You can [delete a baseline](#) without deleting the Baseline File Integrity Monitor task by using the command line.

The Baseline File Integrity Monitor task tracks the following changes of files in the monitoring scope:

- the monitoring scope contains file which is not present in the baseline
- the monitoring scope does not contain a file present in the baseline
- the hash of a file in the monitoring scope differs from the hash of this file in a baseline

The Baseline File Integrity Monitor task does not track changes to file's attributes and alternative streams.

If a file or a folder is inaccessible, Kaspersky Embedded Systems Security will not add this file or folder to the baseline during the baseline creation and will create an event about a failure to calculate file's checksum during the run of the Baseline File Integrity Monitor task.

A file or a folder may be inaccessible for the following reasons:

- the specified path does not exist
- a type of files specified by mask is not present under the specified path
- the specified file is locked
- the specified file is empty

## Enabling start of On-Demand Scan task from context menu

You can enable the start of On-Demand Scan task for one or several files from a context menu in Microsoft Windows Explorer.

*To enable the start of On-Demand Scan task from a context menu:*

1. Create the following REG files:

Windows Registry Editor Version 5.0.0

[HKEY\_CLASSES\_ROOT\Directory\shell\kess\command]

@="C:\\Temp\\scan.cmd \"%1\""

[HKEY\_CLASSES\_ROOT\\*\shell\kess\command]

@="C:\\Temp\\scan.cmd \"%1\""

[HKEY\_CLASSES\_ROOT\Directory\shell\kess]

@="Scan with Kaspersky Embedded Systems Security\"

"Icon"="\"C:\\Program Files (x86)\\Kaspersky Lab\\Kaspersky Embedded Systems Security\\kavtrayr.dll\",0"

[HKEY\_CLASSES\_ROOT\Directory\shell\kess\DefaultIcon]

@="\"C:\\Program Files (x86)\\Kaspersky Lab\\Kaspersky Embedded Systems Security\\kavtrayr.dll\",0"

[HKEY\_CLASSES\_ROOT\\*\shell\kess]

@="Scan with Kaspersky Embedded Systems Security\"

"Icon"="\"C:\\Program Files (x86)\\Kaspersky Lab\\Kaspersky Embedded Systems Security\\kavtrayr.dll\",0"

[HKEY\_CLASSES\_ROOT\\*\shell\kess\DefaultIcon]

@="\"C:\\Program Files (x86)\\Kaspersky Lab\\Kaspersky Embedded Systems Security\\kavtrayr.dll\",0"

[HKEY\_LOCAL\_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\AppCompatFlags\Layers]

"C:\\Program Files (x86)\\Kaspersky Lab\\Kaspersky Embedded Systems Security\\kavshell.exe"="~ RUNASADMIN"

You need to specify the actual location of the Kaspersky Embedded Systems Security installation folder.

2. Create the scan.cmd file with the following content:

```
@echo off
```

```
set LOGNAME=%RANDOM%
```

```
"C:\\Program Files (x86)\\Kaspersky Lab\\Kaspersky Embedded Systems Security\\kavshell.exe" scan "%~1" /W:c:\\temp\\%LOGNAME%.txt
```

```
echo Scanning is in progress...
```

```
type c:\\temp\\%LOGNAME%.txt
```

```
del c:\\temp\\%LOGNAME%.txt
```

```
timeout /t -1
```

The scan.cmd file must contain the following information:

- The location of kavshell.exe file.
- The location of temporary file containing the scan results.
- Parameters for the KAVSHELL SCAN command.
- The timeout value for closing the console window when the task is finished.

- Copy the `scan.cmd` file to the folder specified in the [HKEY\_CLASSES\_ROOT\Directory\shell\kess\command] REG file.

The C:\Temp folder is used in example.

You don't need to restart the operating system.

## Default On-Demand Scan tasks settings

By default On-Demand Scan tasks have the settings described in the table below. You can configure local system and custom On-Demand Scan tasks.

Default On-Demand Scan tasks settings

Setting	Default value	Description
Scan scope	<p>Applied in local system and custom tasks:</p> <ul style="list-style-type: none"> <li><b>Scan at Operating System Startup:</b> the entire protected device, excluding shared folders and autorun objects.</li> <li><b>Critical Areas Scan:</b> the entire protected device, excluding shared folders and certain operating system files.</li> <li><b>Custom On-Demand Scan tasks:</b> the entire protected device.</li> </ul>	<p>You can change the scan scope. The scan scope cannot be configured for the <b>Quarantine Scan</b> and <b>Application Integrity Control</b> local system tasks.</p> <p>The <b>Scan at Operating System Startup</b> task is created automatically after installation. By default, the <b>Notify only</b> mode is applied. In this case, after you deploy Kaspersky Embedded Systems Security on the devices, you can enable the <b>Scan at Operating System Startup</b> task if no issues with system services were discovered during scan. If the application detects critical system services as infected or probably infected objects, the <b>Notify only</b> mode gives you time to figure out the reason and solve the issue. If the application applies the <b>Perform recommended action</b> mode, which calls the <b>Disinfect. Remove if disinfection fails</b> action, disinfection or removal of the system files may result in critical issues with the operating system startup.</p>
Security settings	Common settings for the	For nodes selected in the protected device's file resource list or tree, you can:

	entire scan scope correspond to the <b>Recommended</b> security level.	<ul style="list-style-type: none"> <li>• Select a different predefined security level</li> <li>• Manually change security settings</li> </ul> <p>You can save a group of security settings for a selected node as a template to use later for a different node.</p>
<b>Use heuristic analyzer</b>	<p>It is used with the <b>Medium</b> analysis level for Critical Areas Scan, Scan at Operating System Startup, and custom tasks.</p> <p>It is used with the <b>Deep</b> analysis level for the Quarantine Scan task.</p>	<p>Heuristic Analyzer can be enabled or disabled and the analysis level can be configured. The Quarantine Scan task analysis level cannot be configured.</p> <p>Heuristic Analyzer is not used in the Application Integrity Control and Baseline File Integrity Monitor tasks.</p>
<b>Apply Trusted Zone</b>	Applied (Not applied for Quarantine Scan task)	General list of exclusions that can be used in selected tasks.
<b>Use KSN for scanning</b>	Applied	You can improve your device's protection using the Kaspersky Security Network cloud service infrastructure.
Settings to start a task with specific permissions	The task is started under the system account.	You can edit settings to start tasks with specific account permissions for all system and custom On-Demand Scan tasks, except Quarantine Scan and Application Integrity Control tasks.
<b>Perform task in background mode</b> (low priority)	Not applied	You can configure the priority level of On-Demand Scan tasks.
Task start schedule	<p>Applied in local system tasks:</p> <ul style="list-style-type: none"> <li>• Scan at Operating System Startup - <b>At application launch</b></li> <li>• Critical Areas Scan - <b>Weekly</b></li> </ul>	You can configure the settings for scheduled task startup.

	<ul style="list-style-type: none"> <li>• Quarantine Scan - <b>After application database update</b></li> <li>• Application Integrity Control - <b>Daily</b></li> </ul> <p>Not used in newly created custom tasks.</p>	
Registering scan execution and updating the device protection status	The device protection status is updated weekly after the Critical Areas Scan is performed.	<p>You can configure settings for registering the execution of the Critical Areas Scan in the following ways:</p> <ul style="list-style-type: none"> <li>• Edit the settings of the Critical Areas Scan task start schedule.</li> <li>• Edit the scan scope of the Critical Areas Scan task.</li> <li>• Create custom On-Demand Scan tasks.</li> </ul>

## Managing On-Demand Scan tasks via the Administration Plug-in

In this section, learn how to navigate the Administration Plug-In interface and configure task settings for one or all protected devices on the network.

### Navigation

Learn how to navigate to the required task settings via the chosen interface.

### Opening the On-Demand Scan task wizard

*To start creating a new custom On-Demand Scan task:*

1. To create a local task:
  - a. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console.
  - b. Select the administration group that the protected device belongs to.
  - c. In the results pane, on the **Devices** tab open the context menu for the protected device.
  - d. Select the **Properties** menu option.
  - e. In the window that opens, click the **Add** button in the **Tasks** section.

The **New Task Wizard** window opens.

2. To create a group task:

- a. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
- b. Select the administration group for which you want to create a task.
- c. Open the **Tasks** tab.
- d. Click the **Create a task** button.

The **New Task Wizard** window opens.

3. To create a task for a custom group of protected devices:

- a. In the **Device selections** node in the Kaspersky Security Center Administration Console tree, click the **Run selection** button to perform a device selection.
- b. Open the **Selection results "selection name"** tab.
- c. In the **Perform selection** drop-down list, select the **Create a task for a selection result** option.

The **New Task Wizard** window opens.

4. Select the **On-Demand Scan** task in the list of available tasks for Kaspersky Embedded Systems Security.

5. Click **Next**.

The **Settings** window opens.

Configure the task settings as required.

*To configure an existing On-Demand Scan task,*

double-click the task name in the list of Kaspersky Security Center tasks.

The **Properties: On-Demand Scan** window opens.

## Opening the On-Demand Scan task properties

*To open the application properties for the On-Demand Scan task for a single protected device:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group that the protected device belongs to.
3. Select the **Devices** tab.
4. Double-click the name of the protected device for which you want to configure the scan scope.  
The **Properties: <Protected device name>** window opens.
5. Select the **Tasks** section.

6. In the list of tasks created for the device, select the On-Demand Scan task that you created.
7. Click the **Properties** button.  
The **Properties: On-Demand Scan** window opens.  
Configure the task settings as required.

## Creating an On-Demand Scan task

*To create a custom On-Demand Scan task:*

1. Open the **Settings** window in the New Task Wizard.
2. Select the required **Task creation method**.
3. Click **Next**.
4. Create a scan scope in the **Scan scope** window:

By default, the scan scope includes critical areas of the protected device. Scan scopes are marked in the table with the icon . Excluded scan scopes are marked with the  icon in the table.

You can change the scan scope: add specific preset scan scopes, disks, folders, network objects and files and assign specific security settings for each scope added.

- To exclude all critical areas from the scan, open the context menu on each of the lines and select the **Remove scope** option.
- To include a predefined scan scope, disk, folder, network object, or file in the scan scope:
  - a. Right-click the **Scan scope** table and select **Add scope** or click the **Add** button.
  - b. In the **Add objects to the scan scope** window, select the predefined scope in the **Predefined scope** list, specify the protected device drive, folder, network object, or file on the protected device or on another network protected device, and click the **OK** button.
- To exclude subfolders or files from the scan, select the added folder (disk) in the **Scan scope** window of the wizard:
  - a. Open the context menu and select the **Configure** option.
  - b. Click the **Settings** button in the **Security level** window.
  - c. On the **General** tab in the **On-demand scan settings** window clear the **Subfolders** and **Subfiles** check boxes.
- To change scan scope security settings:
  - a. Open the context menu on the scope whose settings you wish to configure, and select **Configure**.

- b. In the **On-demand scan settings** window, select one of the predefined security levels, or click the **Settings** button to configure security settings manually.

Security settings are configured the same way as for the [Real-Time File Protection task](#).

- To skip embedded objects in the added scan scope:
    - a. Open the context menu on the **Scan scope** table, select **Add exclusion**.
    - b. Specify the objects to exclude: select predefined scope in the **Predefined scope** list, specify the protected device disk, folder, network object, or file on the protected device or on another network protected device.
    - c. Click the **OK** button.
5. In the **Options** window, configure the heuristic analyzer and integration with other components:
    - Configure use of the [heuristic analyzer](#).
    - Select the [Apply Trusted Zone](#) check box, if you want to exclude objects added to the Trusted Zone list from the scan scope of the task.
    - Select the [Use KSN for scanning](#) check box, if you want to use Kaspersky Security Network cloud services for the task.
    - To assign *Low* priority to the working process in which the task will be executed, select the [Perform task in background mode](#) check box in the **Options** window.
- By default, the working processes in which Kaspersky Embedded Systems Security tasks are run have *Medium* (Normal) priority.
- To use the created task as a Critical Areas Scan task, select the [Consider task as critical areas scan](#) check box in the **Options** window.
6. Click **Next**.
  7. In the **Schedule** window, set the scheduled task start settings.
  8. Click **Next**.
  9. In the **Selecting an account to run the task** window, specify the account you want to use.
  10. Click **Next**.
  11. Specify a task name.
  12. Click **Next**.

The task name should be no longer than 100 characters and cannot contain the following symbols: " \* < > & \ : |

The **Finish creating the task** window opens.

13. You can optionally run the task after the Wizard finishes by selecting the **Run task after Wizard finishes** check box.

14. Click **Finish** to finish creating the task.

The new On-Demand Scan task will be created for the selected protected device or a group of protected devices.

## Assigning the Critical Areas Scan status to an On-Demand Scan task

By default, Kaspersky Security Center assigns the *Warning* status to the protected device if the Critical Areas Scan task is performed less often than specified by the *Critical areas scan has not been performed for a long time* event-generation threshold in Kaspersky Embedded Systems Security.

*To configure scanning of all protected devices in a single administration group:*

1. [Create a group On-Demand Scan task](#).
2. In the **Options** window of the task wizard, select the **Consider task as critical areas scan** check box. The specified task settings (the scan scope and security settings) will be applied to all protected devices in the group. Configure the task schedule.

You can select the **Consider task as critical areas scan** check box when creating the On-Demand Scan task for a group of protected devices or later in the [Properties: <Task name> window](#).

3. Using a new or existing policy, disable the [scheduled start of On-Demand Scan local system tasks](#) on the group protected devices.

Kaspersky Security Center Administration Server will then evaluate the security status of the protected device and will notify you about it based on the results of the last run of a task with the Critical Areas Scan status, rather than based on the results of the Critical Areas Scan local system task.

You can assign the *Critical Areas Scan* status both to On-Demand Scan group tasks and to tasks for groups of protected devices.

The Application Console can be used to view whether an On-Demand Scan task is a Critical Areas Scan task.

In the Application Console, the **Consider task as critical areas scan** check box is displayed in the task properties but cannot be edited.

## Running an On-Demand Scan task in the background

By default the processes in which Kaspersky Embedded Systems Security tasks are executed are assigned the *Medium (Normal)* priority.

A process that will run an On-Demand Scan task can be assigned *Low* priority. Demoting the process priority increases the time required to execute the task, but may have a beneficial effect on the performance of the processes of other running programs.

Multiple background tasks can be running in a single worker process with low priority. You can specify the maximum number of processes for On-Demand Scan background tasks.

*To change the priority of an existing On-Demand Scan task:*

1. [Open the Properties: On-Demand Scan window.](#)
2. Select or clear the [Perform task in background mode](#)  check box.
3. Click **OK**.

Configured task settings are saved and applied immediately to the running task. If the task is not running, the modified settings are applied at next start.

## Registering execution of a Critical Areas Scan

By default, the device protection status is displayed in the results pane of the **Kaspersky Embedded Systems Security** node and is updated weekly after the Critical Areas Scan task is performed.

The time when the device protection status is updated is linked to the schedule of the On-Demand task for which the **Consider task as critical areas scan** check box is selected. By default, the check box is selected only for the Critical Areas Scan task and cannot be modified for this task.

You can select the On-Demand Scan task linked to the device's protection status only from Kaspersky Security Center.

## Configuring the task scan scope

If you modify the scan scope in the Scan at Operating System Startup and Critical Areas Scan tasks, you can restore the default scan scope in these tasks by repairing Kaspersky Embedded Systems Security itself (**Start > Programs > Kaspersky Embedded Systems Security > Modify or Remove Kaspersky Embedded Systems Security**). In the setup wizard, select **Repair installed components** and click **Next**. Then select the **Restore recommended application settings** check box.

*To configure a scan scope for an existing On-Demand Scan task:*

1. [Open the Properties: On-Demand Scan window.](#)
2. Select the **Scan scope** tab.
3. To include items in the scan scope:
  - a. Open the context menu in an empty part of the scan scope list.
  - b. Select the **Add scope** option in the context menu.
  - c. In the opened **Add objects to the scan scope** window select an object type that you want to add:
    - **Predefined scope** – to add one of the predefined scopes on a protected device. Then in the drop-down list, select the desired scan scope.

- **Disk, folder or network location** – to include an individual drive, folder or network object in the scan scope. Then select the desired scope by clicking the **Browse** button.
- **File** – to include an individual file in the scan scope. Then select the desired scope by clicking the **Browse** button.

You cannot add an object to a scan scope if it has already been added as an exclusion from scan scope.

- To exclude individual nodes from the scan scope, clear the check boxes next to the names of these nodes or take the following steps:
  - Open the context menu on the scan scope by right-clicking it.
  - In the context menu, select the **Add exclusion** option.
  - In the **Add exclusion** window, select an object type that you want to add as an exclusion from the scan scope following the procedure used when adding an object to the scan scope.
- To modify the scan scope or an added exclusion, select the **Edit scope** option in the context menu for the corresponding scan scope.
- To hide a previously added scan scope or exclusion in the list of network file resources, select the **Remove scope** option in the context menu for the necessary scan scope.

The scan scope is excluded from the On-Demand Scan task scope when it is removed from the network file resource list.

- Click the **OK** button.

The scan scope settings window closes. The newly configured settings are saved.

## Selecting predefined security levels for On-Demand Scan tasks

You can apply one of the following three predefined security levels to a node selected in the protected device's file resource list: **Maximum performance**, **Recommended**, and **Maximum protection**.

*To select one of the predefined security levels:*

- Open the [Properties: On-Demand Scan](#) window.
- Select the **Scan scope** tab.
- In the list of the protected device's list, select an item included in the scan scope in order to set a predefined security level.
- Click the **Configure** button.
 

The **On-demand scan settings** window opens.
- On the **Security level** tab select the security level to be applied.

The window displays the list of security settings corresponding to the security level selected.

6. Click the **OK** button.

7. Click the **OK** button in the **Properties: On-Demand Scan** window.

Configured task settings are saved and applied immediately to a running task. If the task is not running, the modified settings are applied at next start.

## Configuring security settings manually

By default, On-Demand Scan tasks use common security settings for the entire scan scope.

These settings correspond to the **Recommended** [predefined security level](#).

The default values of security settings can be modified by configuring them as common settings for the entire scan scope or as different settings for different items in the protected device's file resource list or nodes in the tree.

*To configure security settings manually:*

1. [Open the Properties: On-Demand Scan window](#).

2. Select the **Scan scope** tab.

3. Select the items in the scan scope list whose security settings you want to configure.

A predefined [template containing security settings](#) can be applied for a selected node or item in the scan scope.

4. Click the **Configure** button.

The **On-demand scan settings** window opens.

5. On the following tabs configure the security settings of the selected node or item in accordance with your requirements:

- [General](#)
- [Actions](#)
- [Performance](#)
- **Hierarchical storage**

6. Click **OK** in the **On-demand scan settings** window.

7. Click **OK** in the **Scan scope** window.

The new scan scope settings are saved.

## Configuring general task settings

To configure general On-Demand Scan task settings:

1. Open the [Properties: On-Demand Scan](#) window.
2. Select the **Scan scope** tab.
3. Click the **Configure** button.

The **On-demand scan settings** window opens.

4. Click the **Settings** button.
5. On the **General** tab, in the **Scan objects** group box, specify the object types that you want to include in the scan scope:

- **Objects to scan:**
  - [All objects](#)
  - [Objects scanned by format](#)
  - [Objects scanned according to list of extensions specified in anti-virus database](#)
  - [Objects scanned by specified list of extensions](#)
- **Subfolders**
- **Subfiles**
- [Scan disk boot sectors and MBR](#)
- [Scan alternate NTFS streams](#)

6. In the **Performance** group box, select or clear the [Scan only new and modified files](#) check box.

To switch between available options when the check box is cleared, click on the **All / Only new** link for each of the compound object types.

7. In the **Scan of compound objects** group box, specify the compound objects that you want to include in the scan scope:

- [All](#) / [Only new archives](#)
- [All](#) / [Only new SFX archives](#)
- [All](#) / [Only new email databases](#)
- [All](#) / [Only new packed objects](#)
- [All](#) / [Only new plain email](#)
- [All](#) / [Only new embedded OLE objects](#)

8. Click **OK**.

The new task configuration will be saved.

## Configuring actions

*To configure actions on infected and other detected objects during the On-Demand Scan task:*

1. Open the [Properties: On-Demand Scan](#) window.
2. Select the **Scan scope** tab.
3. Click the **Configure** button.  
The **On-demand scan settings** window opens.
4. Click the **Settings** button.
5. Select the **Actions** tab.
6. Select the action to be performed on infected and other detected objects:
  - [Notify only](#)
  - **Disinfect.**
  - **Disinfect. Remove if disinfection fails.**
  - [Remove](#).
  - **Perform recommended action.**
7. Select the action to be performed on probably infected objects:
  - [Notify only](#)
  - **Quarantine.**
  - [Remove](#).
  - [Perform recommended action](#).
8. Configure actions to be performed on objects depending on the type of object detected:
  - a. Clear or select the [Perform actions depending on the type of object detected](#) check box.
  - b. Click the **Settings** button.
  - c. In the window that opens, select a primary action and a secondary action (to be performed if the primary action fails) for each type of detected object.
  - d. Click **OK**.
9. Select the action to perform on incurable compound objects: select or clear the [Entirely remove compound file that cannot be modified by the application in case of embedded object detection](#) check box.
10. Click **OK**.

The new task configuration will be saved.

## Configuring performance

*To configure performance settings for the On-Demand Scan task:*

1. Open the [Properties: On-Demand Scan](#) window.
2. Select the **Scan scope** tab.
3. Click the **Configure** button.  
The **On-demand scan settings** window opens.
4. Click the **Settings** button.
5. Select the **Performance** tab.
6. In the **Exclusions** section:
  - Clear or select the [Exclude files](#) check box.
  - Clear or select the [Do not detect](#) check box.
  - Click the **Edit** button for each setting to add exclusions.
7. In the **Advanced settings** section:
  - [Stop scanning if it takes longer than \(sec.\)](#)
  - [Do not scan compound objects larger than \(MB\)](#)
  - [Use iSwift technology](#)
  - [Use iChecker technology](#)
8. Click **OK**.

The new task configuration will be saved.

## Configuring Removable Drives Scan

*To configure scanning of removable drives upon connection to the protected device:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Policies** tab.
4. Double-click the policy name you want to configure.  
In the **Properties: <Policy name>** window that opens, select the **Supplementary** section.

5. Click the **Settings** button in the **Removable Drives Scan** subsection.

The **Removable Drives Scan** window opens.

6. In the **Scan on connection** section do the following:

- Select the **Scan removable drives on connection via USB** check box, if you want Kaspersky Embedded Systems Security to automatically scan removable drives when they are connected.
- If required, select the **Scan removable drives if its stored data volume does not exceed (MB)** and specify the maximum value in the field on the right.
- In the **Scan with security level** drop-down list specify the security level with the settings that are required for removable drives scanning.

7. Click **OK**.

The specified settings are saved and applied.

## Configuring a Baseline File Integrity Monitor task

*To configure the Baseline File Integrity Monitor group task:*

1. In the Kaspersky Security Center Administration Console tree, expand the **Managed devices** node and select the administration group for which you want to configure the application tasks.
2. In the details pane of a selected administration group, open the **Tasks** tab.
3. In the list of previously created group tasks, select a task you want to configure.
4. Open the **Properties: <Task name>** window in one of the following ways:
  - Double-click the name of the task in the list of created tasks.
  - Select the name of the task in the list of created tasks and click the **Configure task** link.
  - Open the context menu of the task name in the list of created tasks and select the **Properties** item.

In the **Notification** section, configure the task event notification settings. For detailed information on how to configure settings in this section, see *Kaspersky Security Center Help*.

5. In the **Scan scope** section do the following:

a. To include folder in the Baseline File Integrity Monitor task scope:

1. Click the **Add** button.

The **Scan area properties** window opens.

2. Select or clear the **Scan this area** check box.

3. Click the **Browse** button to specify the folder that you want to include in the Baseline File Integrity Monitor task scope.

4. Select the **Also scan subfolders** check box, if you want to include all subfolders in the Baseline File Integrity Monitor task scope.

- b. To include or exclude the folder previously added to the Baseline File Integrity Monitor task scope select or clear the check box to the left of the folder's path in the **Scan scope** table.
  - c. To delete the folder previously added to the Baseline File Integrity Monitor task scope select this folder in the **Scan scope** table and click the **Delete** button.
6. Configure the task schedule in the **Schedule** section (you can configure a schedule for all task types except Rollback of Database Update).
  7. In the **Account** section, specify the account whose rights will be used to run the task.
  8. If required, specify the objects to exclude from the task scope in the **Exclusions from task scope** section.

For detailed information on configuring settings in these sections, see *Kaspersky Security Center Help*.

9. In the **Properties: <Task name>** window, click **OK**.

The newly configured group task settings are saved.

## Managing On-Demand Scan tasks via the Application Console

In this section, you will learn how to navigate the Application Console interface and configure task settings on a protected device.

### Navigation

Learn how to navigate to the required task settings via the chosen interface.

### Opening the On-Demand Scan task settings

*To open the general settings of the On-Demand Scan task via the Application Console:*

1. Expand the **On-Demand Scan** node in the Application Console tree.
2. Select the child node that corresponds to the task that you want to configure.
3. In the child node results pane click the **Properties** link.

The **Task settings** window opens.

### Opening the On-Demand Scan task scope settings

*To open the scan scope settings window via the Application Console:*

1. Expand the **On-Demand Scan** node in the Application Console tree.

2. Select the child node corresponding to an On-Demand Scan task that you want to configure.
3. In the results pane of the selected node click the **Configure scan scope** link.  
**Scan scope settings** window opens.

## Creating and configuring an On-Demand Scan task

Custom tasks for a single protected device can be created in the **On-Demand Scan** node. Custom tasks cannot be created in the other functional components of Kaspersky Embedded Systems Security.

*To create and configure a new On-Demand Scan task:*

1. In the Application Console tree, open the context menu of the **On-Demand Scan** node.
  2. Select **Add task**.  
The **Add task** window opens.
  3. Configure the following task settings:
    - **Name** – A task name consisting of no more than 100 characters. It may contain any symbols except " \* < > & \ : |.
- You cannot save a task or configure a new task on the **Schedule**, **Advanced** and **Run as** tabs if the task name is not specified.
- **Description** – Any additional information about the task. No more than 2000 characters. This information will be displayed in the task properties window.
  - [Use heuristic analyzer](#)
  - [Perform task in background mode](#)
  - [Apply Trusted Zone](#)
  - [Consider task as critical areas scan](#)
  - [Use KSN for scanning](#)
    4. Configure the [task start schedule settings](#) on the **Schedule** and **Advanced** tabs.
    5. On the **Run as** tab, configure the [settings to start the task using specific account permissions](#).
    6. Click **OK** in the **Add task** window.  
A new custom On-Demand Scan task is created. A node with the name of the new task is displayed in the Application Console tree. The operation is recorded in the [system audit log](#).
    7. If required, in the results pane of the selected node, select **Configure scan scope**.  
The **Scan scope settings** window opens.
    8. In the protected device's file resource tree or list, select the nodes or items that you want to include in the scan scope.

9. Select one of the [predefined security levels](#) or configure the scan settings [manually](#).

10. Click **Save** in the **Scan scope settings** window.

The configured settings are applied at the next task start.

## Scan scope in On-Demand Scan tasks

This section contains information on creating and using a scan scope in On-Demand Scan tasks.

## Configuring the view for network file resources

*To select the view for network file resources during configuration of scan scope settings:*

1. Open the [Scan scope settings](#) window.
2. Open the drop-down list in the upper left section of the window and select one of the following options:
  - Select the **Tree-view** option to display the network file resources as a tree.
  - Select the **List-view** option to display the network file resources as a list.

By default, the network file resources of the protected device are displayed as a list.

3. Click the **Save** button.

## Creating a scan scope

If you are remotely managing Kaspersky Embedded Systems Security on the protected device using the Application Console installed on an administrator's workstation, you must be a member of administrators group on the protected device to be able to view folders on it.

The names of settings may vary under different Windows operating systems.

If you modify the scan scope in the Scan at Operating System Startup and Critical Areas Scan tasks, you can restore the default scan scope in these tasks by repairing Kaspersky Embedded Systems Security itself (**Start > Programs > Kaspersky Embedded Systems Security > Modify or Remove Kaspersky Embedded Systems Security**). In the setup wizard, select **Repair installed components** and click **Next**. Then select the **Restore recommended application settings** check box.

The procedure of creating an On-Demand Scan task scope depends on the selected view of [network file resources](#). You can configure the view of network file resources as a tree or as a list (default view).

*To create a scan scope using the network file resource tree:*

1. [Open the Scan scope settings window](#).

2. In the left section of the window, open the network file resource tree to display all the nodes and child nodes.

3. Do the following:

- To exclude individual nodes from the scan scope, clear the check boxes next to the names of these nodes.
- To include individual nodes in the scan scope, clear the **My Computer** check box and do the following:
  - If all drives of a particular type are to be included in the scan scope, select the check box next to the name of the required drive type (for example, to add all removable drives on the protected device, select the **Removable drives** check box).
  - If an individual drive of a particular type is to be included in the scan scope, expand the node that contains drives of that type and select the check box next to the name of the required drive. For example, to select the removable drive **F:**, expand the **Removable drives** node and select the check box for the **F:** drive.
  - If you would like to include only a single folder or file on the drive, select the check box next to the name of that folder or file.

4. Click the **Save** button.

The **Scan scope settings** window will be closed. Your newly configured settings will be saved.

*To create a scan scope using the network file resource list:*

1. [Open the Scan scope settings window.](#)

2. To include individual nodes in the scan scope, clear the **My Computer** check box and do the following:

- a. Open the context menu of the scan scope by right-clicking it.
- b. In the context menu of the button, select **Add scan scope**.
- c. In the opened **Add scan scope** window, select the type of object that you want to add:
  - **Predefined scope** – to add one of the predefined scopes on a protected device. Then in the drop-down list, select the desired scan scope.
  - **Disk, folder or network location** – to include an individual drive, folder or network object in the scan scope. Then select the desired scope by clicking the **Browse** button.
  - **File** – to include an individual file in the scan scope. Then select the desired scope by clicking the **Browse** button.

You cannot add an object into a scan scope if it has already been added as an exclusion from the scan scope.

3. To exclude individual nodes from the scan scope, clear the check boxes next to the names of these nodes or take the following steps:

- a. Open the context menu of the scan scope by right-clicking it.
- b. In the context menu, select **Add exclusion** option.

- c. In the **Add exclusion** window, select the type of object that you want to add as an exclusion from the scan scope following the procedure used when adding an object to the scan scope.
4. To modify the scan scope or an exclusion added, select the **Edit scope** option in the context menu for the necessary scan scope.
5. To hide a previously added scan scope or an exclusion in the list of network file resources, select the **Remove from the list** option in the context menu for the corresponding scan scope.

The scan scope is excluded from the On-Demand Scan task scope when it is removed from the network file resource list.

6. Click the **Save** button.

The **Scan scope settings** window will be closed. Your newly configured settings will be saved.

## Including network objects in the scan scope

Network drives, folders or files can be added to the scan scope by specifying their path in UNC (Universal Naming Convention) format.

You can scan network folders under the system account.

*To add a network location to the scan scope:*

1. Open the [Scan scope settings](#) window.
2. Open the drop-down list in the upper left part of the window and select **Tree-view**.
3. In the context menu of the **Network** node:
  - Select **Add network folder**, if you want to add a network folder to the scan scope.
  - Select **Add network file**, if you want to add a network file to the scan scope.
4. Enter the path to the network folder or file in UNC format and press the **ENTER** key.
5. Select the check box next to the newly added network object to include it in the scan scope.
6. If necessary, change the security settings for the added network object.
7. Click the **Save** button.

The modified task settings are saved.

## Creating a virtual scan scope

Virtual drives, folders, and files can be included in the scan scope in order to create a virtual scan scope.

You can expand the scan scope by adding individual virtual drives, folders, or files only if the scan scope is viewed as a [file resources tree](#).

*To add a virtual drive to the scan scope:*

1. Open the [Scan scope settings](#) window.
2. Open the drop-down list in the upper left part of the window and select **Tree-view**.
3. In the protected device's file resource tree, open the context menu of the **Virtual drives** node, click **Add virtual drive** and select the name of the virtual drive from the list of available names.
4. Select the check box next to the added drive in order to include the drive in the scan scope.
5. Click the **Save** button.

The modified task settings are saved.

*To add a virtual folder or virtual file to the scan scope:*

1. [Open the Scan scope settings window](#).
2. Open the drop-down list in the upper left part of the window and select **Tree-view**.
3. In the protected device's file resource tree, open the context menu of the node to add a folder or file, and select one of the following options:
  - **Add virtual folder** if you want to add a virtual folder to the scan scope.
  - **Add virtual file** if you want to add a virtual file to the scan scope.
4. In the entry field specify the name of the folder or file.
5. In the line with the name of the folder or file, select the check box to include this folder or file in the scan scope.
6. Click the **Save** button.

The modified task settings are saved.

## Configuring security settings

By default On-Demand Scan tasks use common security settings for the entire scan scope.

These settings correspond to the **Recommended** [predefined security level](#).

The default values of security settings can be modified by configuring them as common settings for the entire scan scope or as different settings for different items in the protected device's file resource list or nodes in the tree.

When working with the network file resource tree, security settings that are configured for the selected parent node are automatically applied to all child nodes. The security settings of the parent node are not applied to child nodes that are configured separately.

To configure security settings manually:

1. Open the [Scan scope settings](#) window.
2. In the left part of the window, select the node or item whose security settings you want to configure.  
A predefined [template containing security settings](#) can be applied to the selected node or item in the scan scope.  
In the left part of the window, you can select [the view for network file resources](#), [create a scan scope](#), or [create a virtual scan scope](#).
3. In the right part of the window, do one of the following:
  - On the **Security level** tab [select the security level](#) to be applied.
  - On the following tabs configure the required security settings of the selected node or item in accordance with your requirements:
    - [General](#)
    - [Actions](#)
    - [Performance](#)
    - [Hierarchical storage](#)
4. Click **Save** in the **Scan scope settings** window.

The new scan scope settings are saved.

## Selecting predefined security levels for On-Demand Scan tasks

You can apply one of the following three predefined security levels to a node selected in the protected device's file resource tree or list: **Maximum performance**, **Recommended**, and **Maximum protection**.

To select one of the predefined security levels:

1. Open the [Scan scope settings](#) window.
2. In the protected device's network file resource tree or list, select a node or item to set the predefined security level.
3. Make sure that the selected node or item is included in the scan scope.
4. In the right part of the window, on the **Security level** tab select the security level to be applied.  
The window displays the list of security settings corresponding to the selected security level.
5. Click the **Save** button.

The task settings are saved and applied immediately to the running task. If the task is not running, the modified settings are applied at the next start.

## Configuring general task settings

To configure the general security settings of the On-Demand Scan task:

1. Open the [Scan scope settings](#) window.
2. Select the **General** tab.
3. In the **Scan objects** group box, specify the object types that you want to include in the scan scope:
  - **Objects to scan:**
    - [All objects](#)
    - [Objects scanned by format](#)
    - [Objects scanned according to list of extensions specified in anti-virus database](#)
    - [Objects scanned by specified list of extensions](#)
  - [Scan disk boot sectors and MBR](#)
  - [Scan alternate NTFS streams](#)
4. In the **Performance** group box, select or clear the [Scan only new and modified files](#) check box.

To switch between available options when the check box is cleared, click the **All / Only new** link for each of the compound object types.

5. In the **Scan of compound objects** group box, specify the compound objects that you want to include in the scan scope:
  - [All](#) / [Only new archives](#)
  - [All](#) / [Only new SFX archives](#)
  - [All](#) / [Only new email databases](#)
  - [All](#) / [Only new packed objects](#)
  - [All](#) / [Only new plain email](#)
  - [All](#) / [Only new embedded OLE objects](#)
6. Click **Save**.

The new task configuration will be saved.

## Configuring actions

To configure the actions on infected and other detected objects for the On-Demand Scan task:

1. Open the [Scan scope settings](#) window.
  2. Select the **Actions** tab.
  3. Select the action to be performed on infected and other detected objects:
    - [Notify only](#)
    - **Disinfect.**
    - **Disinfect. Remove if disinfection fails.**
    - [Remove](#).
    - **Perform recommended action.**
  4. Select the action to be performed on probably infected objects:
    - [Notify only](#)
    - **Quarantine.**
    - [Remove](#).
    - [Perform recommended action](#).
  5. Configure actions to be performed on objects depending on the type of object detected:
    - a. Clear or select the [Perform actions depending on the type of object detected](#) check box.
    - b. Click the **Settings** button.
    - c. In the window that opens, select a primary action and a secondary action (to be performed if the primary action fails) for each type of detected object.
    - d. Click **OK**.
  6. Select the action to perform on incurable compound objects: select or clear the [Entirely remove compound file that cannot be modified by the application in case of embedded object detection](#) check box.
  7. Click **Save**.
- The new task configuration will be saved.

## Configuring performance

To configure performance settings for the On-Demand Scan task:

1. Open the [Scan scope settings](#) window.
2. Select the **Performance** tab.

3. In the **Exclusions** section:

- Clear or select the [Exclude files](#) check box.
- Clear or select the [Do not detect](#) check box.
- Click the **Edit** button for each setting to add exclusions.

4. In the **Advanced settings** section:

- [Stop scanning if it takes longer than \(sec.\)](#)
- [Do not scan compound objects larger than \(MB\)](#)
- [Use iSwift technology](#)
- [Use iChecker technology](#)

5. Click **Save**.

The new task configuration will be saved.

## Configuring hierarchical storage

*To configure the actions performed on infected and other detected objects for the On-Demand Scan task:*

1. Open the [Scan scope settings](#) window.
2. Select the **Hierarchical storage** tab.
3. Select the action to be performed on the files:

- **Do not scan.**
- **Scan resident part of file only.**
- **Scan entire file.**

If this action is selected, you can specify the following options:

- Select or clear the **Only if the file has been accessed within the specified period (days)** check box and specify the number of days.
- Select or clear the **Do not copy file to a local hard drive, if possible** check box.

4. Click **Save**.

The new task configuration will be saved.

## Scanning removable drives

*To configure scanning of the removable drives upon connection to the protected device in the Application Console:*

1. In the Application Console tree, open the context menu of the **Kaspersky Embedded Systems Security** node and select the **Configure removable drives scan settings** option.

The **Removable Drives Scan** window opens.

2. In the **Scan on connection** section do the following:

- Select the **Scan removable drives on connection via USB** check box, if you want Kaspersky Embedded Systems Security to automatically scan removable drives when they are connected.
- If required, select the **Scan removable drives if its stored data volume does not exceed (MB)** and specify the maximum value in the field on the right.
- In the **Scan with security level** drop-down list specify the security level with the settings that are required for removable drives scanning.

3. Click **OK**.

The specified settings are saved and applied.

## On-Demand Scan task statistics

While the On-Demand Scan task is being executed, you can view information about the number of objects processed by Kaspersky Embedded Systems Security since it was started.

This information remains available even if the task is paused. You can view the task statistics in the [task log](#).

*To view the statistics of an On-Demand Scan task:*

1. Expand the **On-Demand Scan** node in the Application Console tree.
2. Select the On-Demand Scan task whose statistics you want to view.

Task statistics are displayed in the **Statistics** section of the results pane of the selected node.

Information about objects processed by Kaspersky Embedded Systems Security since it was started is presented in the table below.

On-Demand Scan task statistics

Field	Description
<b>Detected</b>	Number of objects detected by Kaspersky Embedded Systems Security. For example, if Kaspersky Embedded Systems Security detects one malicious object in five files, the value in this field increases by one.
<b>Infected and other objects detected</b>	Number of objects that Kaspersky Embedded Systems Security found and classified as infected or number of found legitimate software files that were not excluded from the scan scope and were classified as legitimate software that can be used by intruders to damage your device or personal data.
<b>Probably infected objects detected</b>	Number of objects detected by Kaspersky Embedded Systems Security as probably infected.
<b>Objects not</b>	Number of objects that Kaspersky Embedded Systems Security did not disinfect for the following reasons:

<b>disinfected</b>	<ul style="list-style-type: none"> <li>The detected object is of a type that cannot be disinfected.</li> <li>An error occurred during disinfection.</li> </ul>
<b>Objects not moved to Quarantine</b>	Number of objects that Kaspersky Embedded Systems Security attempted to quarantine unsuccessfully, for example, due to insufficient disk space.
<b>Objects not removed</b>	Number of objects that Kaspersky Embedded Systems Security attempted to delete unsuccessfully, because, for example, access to the object was blocked by another application.
<b>Objects not scanned</b>	Number of objects in the protection scope that Kaspersky Embedded Systems Security failed to scan, because, for example, access to the object was blocked by another application.
<b>Objects not backed up</b>	Number of objects whose copies Kaspersky Embedded Systems Security attempted to save in Backup unsuccessfully, for example, due to insufficient disk space.
<b>Processing errors</b>	Number of objects whose processing resulted in an error.
<b>Objects disinfected</b>	Number of objects disinfected by Kaspersky Embedded Systems Security.
<b>Moved to Quarantine</b>	Number of objects quarantined by Kaspersky Embedded Systems Security.
<b>Moved to Backup</b>	Number of objects whose copies Kaspersky Embedded Systems Security saved to Backup.
<b>Objects removed</b>	Number of objects removed by Kaspersky Embedded Systems Security.
<b>Password-protected objects</b>	Number of objects (archives, for example) that Kaspersky Embedded Systems Security skipped because they were password protected.
<b>Corrupted objects</b>	Number of objects skipped by Kaspersky Embedded Systems Security because their format was corrupted.
<b>Objects processed</b>	Total number of objects processed by Kaspersky Embedded Systems Security.

You can also view the On-Demand Scan task statistics in the selected task log by clicking the **Open task log** link in the **Management** section of the results pane.

We recommend that you manually process the events recorded on the **Events** tab in the task log upon task completion.

## Creating and configuring a Baseline File Integrity Monitor task

*To create or configure a new Baseline File Integrity Monitor task:*

1. In the Application Console tree, open the context menu of the **System Inspection** node.

2. Select **Create Baseline File Integrity Monitor task**.

The **Add task** window opens.

3. In the **Hash calculation algorithm** drop-down list, select one of the options:

- **MD5**
- **SHA256**

4. In the **Scan areas** table do the following:

a. To add a file or folder in the Baseline File Integrity Monitor task scope:

1. Click the **Add** button.

The **Scan area properties** window opens.

2. Select or clear the **Scan this area** check box.

3. Click the **Browse** button to specify the file or folder that you want to include in the Baseline File Integrity Monitor task scope.

4. Select the **Also scan subfolders** check box, if you want to include all subfolders in the Baseline File Integrity Monitor task scope.

5. Click **OK**.

b. To change a file or folder previously added to the Baseline File Integrity Monitor task scope:

1. Click the **Change** button.

The **Scan area properties** window opens.

2. Select or clear the **Scan this area** check box.

3. Click the **Browse** button to specify the file or folder that you want to include in the Baseline File Integrity Monitor task scope.

4. Select or clear the **Also scan subfolders** check box, if you want to include or exclude all subfolders from the Baseline File Integrity Monitor task scope.

5. Click **OK**.

c. To delete the file or folder previously added to the Baseline File Integrity Monitor task scope select this file or folder in the **Scan areas** table and click the **Remove** button.

5. Configure the [task start schedule settings](#) on the **Schedule** and **Advanced** tabs.

6. On the **Run as** tab, configure the [settings to start the task using specific account permissions](#).

7. Click **OK** in the **Add task** window.

A new custom Baseline File Integrity Monitor task is created. A node with the name of the new task is displayed in the Application Console tree. The operation is recorded in the [system audit log](#).

*To open the settings of the Baseline File Integrity Monitor task:*

1. Expand the **System Inspection** node in the Application Console tree.

2. Select the child node that corresponds to the task that you want to configure.
3. In the child node results pane click the **Properties** link.  
The **Task settings** window opens.

## Managing On-Demand Scan tasks via the Web Plug-in

In this section, learn how to navigate the Web Plug-in interface for one or all protected devices on the network.

### Opening the On-Demand Scan task wizard

*To start creating a new local On-Demand Scan task:*

1. In the main window of Web Console, select **Devices** → **Managed devices**.
2. Click the **Groups** tab to select the administration group that the protected device belongs to.
3. Click the protected device name.
4. In the <Device name> window that opens select the **Tasks** tab.
5. Click **Add**.  
The **Add Task Wizard** window opens.
6. In the **Application** drop-down list select **Kaspersky Embedded Systems Security**.
7. In the **Task type** drop-down list select **On-Demand Scan** task.
8. Click **Next**.

[Configure the task settings as required.](#)

*To start creating a new group On-Demand Scan task:*

1. In the main window of Web Console, select **Devices** → **Tasks**.
2. Click the **Groups** tab to select the administration group for which you want to create a task.
3. Click **Add**.  
The **Add Task Wizard** window opens.
4. In the **Application** drop-down list select **Kaspersky Embedded Systems Security**.
5. In the **Task type** drop-down list select **On-Demand Scan** task.
6. Click **Next**.

[Configure the task settings as required.](#)

*To start creating a new On-Demand Scan task for a custom group:*

1. In the main window of Web Console, select **Devices** → **Device selections**.
2. Select the selection for which you want to create a task.
3. Click **Start**.
4. In the **Selection results** window, select the devices for which you want to create a task.
5. Click **New task**.
6. In the **Application** drop-down list select **Kaspersky Embedded Systems Security**.
7. In the **Task type** drop-down list select **On-Demand Scan** task.
8. Click **Next**.

[Configure the task settings as required.](#)

*To configure an existing On-Demand Scan task:*

1. In the main window of Web Console, select **Devices** → **Tasks**.
2. Click the task name in the list of Kaspersky Security Center tasks.

The **<Task name>** window opens.

## Opening the On-Demand Scan task properties

*To open the application properties for the On-Demand Scan task for a single protected device:*

1. In the main window of Web Console, select **Devices** → **Managed devices**.
2. Click the **Groups** tab to select the administration group that the protected device belongs to.
3. Click the protected device name.
4. In the **<Device name>** window that opens select the **Tasks** tab.
5. In the list of tasks created for the device, select the On-Demand Scan task that you created.
6. Open the **Application settings** tab.

## Configuring the task scan scope

*To configure a scan scope for an existing On-Demand Scan task:*

1. [Open the On-Demand Scan task properties.](#)
2. Select the **Scan scope** section.
3. Do one of the following:

- Click **Add** button to add a new rule.
- Select an existing rule and click **Edit** button.

The **Edit scope** window opens.

4. Switch the toggle button to **Active** and select an object type.

5. In the **Objects protection** section, configure the following settings:

- **Objects protection mode:**
  - [All objects](#)
  - [Objects scanned by format](#)
  - [Objects scanned according to list of extensions specified in anti-virus database](#)
  - [Objects scanned by specified list of extensions](#)
- **Subfolders**
- **Subfiles**
- [Scan disk boot sectors and MBR](#)
- [Scan alternate NTFS streams](#)
- [Protect only new and modified files](#)

6. In the **Compound objects protection** section, specify the compound objects that you want to include in the scan scope:

- [Archives](#)
- [SFX archives](#)
- [Packed objects](#)
- [Email databases](#)
- [Plain email](#)
- [Embedded OLE objects](#)

7. In the **Action to perform on infected and other objects** section, select the action to be performed on infected and other detected objects:

- [Notify only](#)
- **Disinfect.**
- **Disinfect. Remove if disinfection fails.**
- [Remove](#)

- **Recommended.**
8. In the **Action to perform on probably infected objects** section, select the action to be performed on probably infected objects:
- [Notify only](#)
  - Quarantine.
  - [Remove](#).
  - [Recommended](#).
9. In the **Action to perform on probably infected objects** section, select or clear the [Entirely remove compound file that cannot be modified by the application in case of embedded object detection](#) check box.
10. In the **Exclusions** section, configure the following settings:
- Clear or select the [Exclude files](#) check box.
  - Clear or select the [Do not detect](#) check box.
11. In the **Advanced settings** section, configure the following settings:
- [Stop scanning if it takes longer than \(sec.\)](#)
  - [Do not scan compound objects larger than \(MB\)](#)
  - [Use iSwift technology](#)
  - [Use iChecker technology](#)
12. In the **Action on the offline files** section, select the action to be performed on the files:
- Do not scan.
  - Scan resident part of file only.
  - Scan entire file.
- If this action is selected, you can specify the following options:
- Select or clear the **Only if the file has been accessed within the specified period (days)** check box and specify the number of days.
  - Select or clear the **Do not copy file to a local hard drive, if possible** check box.
13. Click the **OK** button.

## Configuring the task settings

*To configure settings of an existing On-Demand Scan task:*

1. [Open the On-Demand Scan task properties.](#)

2. Select the **Options** section.
3. Clear or select the [Use Heuristic Analyzer](#) check box.
4. If necessary, select the level of analysis using the [Heuristic analysis level](#) drop-down list.
5. In the **Integration with other components** section, configure the following settings:
  - Select the [Apply Trusted Zone](#) check box, if you want to exclude objects added to the Trusted Zone list from the scan scope of the task.
  - Select the [Use KSN for scanning](#) check box, if you want to use Kaspersky Security Network cloud services for the task.
  - To assign *Low* priority to the working process in which the task will be executed, select the [Perform task in background mode](#) check box.

By default, the working processes in which Kaspersky Embedded Systems Security tasks are run have *Medium* (Normal) priority.

- To use the created task as a Critical Areas Scan task, select the [Consider task as critical areas scan](#) check box.

# Trusted Zone

This section provides information about the Trusted Zone in Kaspersky Embedded Systems Security, as well as instructions on how to add objects to the Trusted Zone when running tasks.

## About the Trusted Zone

The Trusted Zone is a list of exclusions from the protection or scan scope that you can generate and apply to On-Demand Scan and Real-Time File Protection tasks, newly created custom On-Demand Scan tasks, and all system On-Demand Scan tasks, except for the Quarantine Scan task.

The Trusted Zone is applied in Real-Time File Protection and On-Demand Scan tasks by default.

The list of rules for generating the Trusted Zone can be exported to an XML configuration file in order to then import it into Kaspersky Embedded Systems Security running on another protected device.

## Trusted processes

Applies to the Real-Time File Protection tasks.

Some applications on the protected device may be unstable if the files that they access are intercepted by Kaspersky Embedded Systems Security. Such applications include, for example, system domain controller applications.

To avoid disrupting the operation of such applications, you can disable protection of files accessed by the running processes of these applications (thereby creating a list of trusted processes within the Trusted Zone).

Microsoft Corporation recommends excluding some Microsoft Windows operating system files and Microsoft application files from Real-Time File Protection as programs that cannot be infected. The names of some of these are listed on the [Microsoft website](#) (article code: KB822158).

You can enable or disable the use of trusted processes in the Trusted Zone.

If an executable file is modified, for example, through an update, Kaspersky Embedded Systems Security will exclude it from the list of trusted processes.

The application does not use the file's path on a protected device to trust the process. The path to the file on the protected device is used only to search for the file, calculate a checksum, and provide the user with the information about the source of the executable file.

## Backup operations

Applies to Real-Time Computer Protection tasks.

When data stored on hard drives is backed up to external devices, you can disable protection of objects that are accessed during the backup operations. Kaspersky Embedded Systems Security will scan objects which the backup application opens for reading with the FILE\_FLAG\_BACKUP\_SEMANTICS attribute.

## Exclusions

- Applies to Real-Time File Protection.
- All detectable objects in the specified areas of the protected device.
- Specified detectable objects by name or name mask within the entire protection or scan scope.

## Managing the Trusted Zone via the Administration Plug-in

In this section, learn how to navigate through the Administration Plug-in interface and configure the Trusted Zone for one or all protected devices of the network.

## Navigation

Learn how to navigate to the required task settings via the chosen interface.

## Opening the Trusted Zone policy settings

*To open the Trusted Zone via the Kaspersky Security Center policy:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Policies** tab.
4. Double-click the policy name you want to configure.
5. In the **Properties: <Policy name>** window that opens, select the **Supplementary** section.
6. Click the **Settings** button in the **Trusted Zone** subsection.

The **Trusted Zone** window opens.

Configure the Trusted Zone as required.

If a protected device is being managed by an active Kaspersky Security Center policy and this policy blocks changes to the application settings, these settings cannot be edited via the Application Console.

## Opening the Trusted Zone properties window

*To configure the Trusted Zone in the Application properties window:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Devices** tab.
4. Open the **Properties: <Protected device name>** window in one of the following ways:
  - Double-click the name of the protected device.
  - Select the **Properties** item in the context menu of the protected device.

The **Properties: <Protected device name>** window opens.

5. In the **Applications** section, select the **Kaspersky Embedded Systems Security 3.2**.
6. Click the **Properties** button.
7. Select the **Supplementary** section.
8. Click the **Settings** button in the **Trusted Zone** subsection.

The **Kaspersky Embedded Systems Security 3.2 application settings** window opens.

The **Trusted Zone** window opens.

Configure the Trusted Zone as required.

## Configuring Trusted Zone settings via the Administration Plug-in

By default, the Trusted Zone is applied for all newly created policies and tasks.

*To configure Trusted Zone settings:*

1. [Specify the objects to be skipped](#) by Kaspersky Embedded Systems Security during task execution on the **Exclusions** tab.
2. [Specify the processes to be skipped](#) by Kaspersky Embedded Systems Security during task execution on the **Trusted processes** tab.
3. [Apply the not-a-virus mask](#).

## Adding an exclusion

*To add an exclusion to the Trusted Zone via the Kaspersky Security Center policy:*

1. [Open the Trusted Zone window](#).
2. On the **Exclusions** tab, specify the objects to be skipped by Kaspersky Embedded Systems Security during scanning and protection:
  - To create recommended exclusions, click the [Add recommended exclusions](#) button.

- To import preconfigured exclusions, click the **Import** button and, in the window that opens, select the configuration file in XML format stored on your device.

Exclusions from the XML file will be added to the exclusion list.

- To manually specify the conditions under which an object will be considered trusted, click the **Add** button and proceed to the next steps.

The **Exclusion** window opens.

3. If you clicked the **Add** button, in the **Object will not be scanned if the following conditions are met** section, specify the objects that you want to exclude from the protection / scan scope and objects that you want to exclude among detectable objects:

- If you want to exclude an object from the protection or scan scope:

a. Select the **Object to scan**  check box.

b. Click the **Edit** button.

The **Select an object** window opens.

c. Specify the object that you want to exclude from the scan scope.

When specifying the objects, you can use names masks (via ? and \* characters) and all types of environment variables. The resolving of environment variables (replacing variables with their values) is performed by Kaspersky Embedded Systems Security when starting a task, or when applying new settings to a running task (not applicable to On-Demand Scan tasks). Kaspersky Embedded Systems Security resolves environment variables under the account used to start the task. For more information on environment variables, refer to the Microsoft Knowledge Base.

d. Click **OK**.

e. Select the **Apply to subfolders** check box, if you want to exclude all child files and folders of the specified object from the protection or scan scope.

- If you want to specify the name of a detectable object:

a. Select the **Objects to detect**  check box.

b. Click the **Edit** button.

The **List of objects to detect** window opens.

c. Specify the name or name mask of the detectable object according to the Virus Encyclopedia classification.

d. Click the **Add** button.

e. Click **OK**.

4. In the **Exclusion usage scope**  section, select the check boxes next to the names of the tasks to which the exclusion should be applied.

5. Click **OK**.

The exclusion is displayed in the list on the **Exclusions** tab of the **Trusted Zone** window.

## Adding trusted processes

To add one or more processes to the list of trusted processes:

1. [Open the Trusted Zone window.](#)
2. Select the **Trusted processes** tab.
3. Select the [Do not check file backup operations](#) check box to skip scanning of file read operations.
4. Select the [Do not check file activity of the specified processes](#) check box to skip file operation scanning for trusted processes.
5. To add processes to the list of trusted processes, do one of the following:
  - To import preconfigured trusted processes, click the **Import** button and, in the window that opens, select the configuration file in XML format stored on your device.  
Processes from the XML file will be added to the list of trusted processes.
  - To manually specify the processes, click the **Add** button and proceed to the next steps.
6. If you clicked the **Add** button, in the button's context menu, select one of the options:

- **Multiple processes.**

In the **Adding trusted processes** window that opens, configure the following:

- a. [Use full process path on disk to consider it trusted](#).
- b. [Use process file hash to consider it trusted](#).
- c. Click the **Browse** button to add data based on executable processes.
- d. Select an executable file in the window that opens.

You can only add one executable file at a time. Repeat steps c-d to add other executable files.

- e. Click the **Processes** button to add data based on running processes.
- f. Select processes in the window that opens. To select multiple processes, press and hold the **CTRL** button while selecting.
- g. Click **OK**.

The account under which the Real-Time File Protection task is run must have administrator rights on the device with Kaspersky Embedded Systems Security installed in order to allow viewing of the list of active processes. You can sort processes in the list of active processes by file name, process identifier (PID), or path to the executable file of the process on the protected device. Note, that you can select running processes by clicking the **Processes** button only using the Application Console on a protected device or in the specified host settings via the Kaspersky Security Center.

- **One process based on file name and path.**

In the **Adding a process** window that opens, do the following:

- a. Enter a path to an executable file (including the file name).

When specifying the objects, you can use names masks (via ? and \* characters) and all types of environment variables. The resolving of environment variables (replacing variables with their values) is performed by Kaspersky Embedded Systems Security when starting a task, or when applying new settings to a running task (not applicable to On-Demand Scan tasks). Kaspersky Embedded Systems Security resolves environment variables under the account used to start the task. For more information on environment variables, refer to the Microsoft Knowledge Base.

- b. Click **OK**.

- **One process based on object properties.**

In the **Trusted process adding** window that opens, configure the following:

- a. Click the **Browse** button to select a process.
- b. [Use full process path on disk to consider it trusted](#).
- c. [Use process file hash to consider it trusted](#).
- d. Click **OK**.

To add the selected process to the list of trusted processes, at least one trust criterion must be selected.

7. In the **Trusted Zone** window, click the **OK** button.

The selected file or process will be added to the list of trusted processes in the **Trusted Zone** window.

## Applying the not-a-virus mask

The not-a-virus mask makes it possible to skip scanning of legitimate software files and web resources that can be considered harmful. The mask affects the following tasks:

- Real-Time File Protection.
- On-Demand scan.

If the mask is not added to the exclusions list, Kaspersky Embedded Systems Security will apply the actions specified in the task settings for the software which fall under this category.

*To apply the not-a-virus mask:*

1. [Open the Trusted Zone window](#).
2. On the **Exclusions** tab, in the **Objects to detect** column, scroll the list and select the line with *not-a-virus:\**, if the check box is cleared.

3. Click **OK**.

The new configuration is applied.

## Managing the Trusted Zone via the Application Console

In this section, learn how to navigate through the Application Console interface and configure the Trusted Zone on a protected device.

## Applying the Trusted Zone to tasks in the Application Console

By default, the Trusted Zone is applied in the Real-Time File Protection task, newly created custom On-Demand Scan tasks, and all system On-Demand Scan tasks, except the Quarantine Scan task.

After the Trusted Zone is enabled or disabled, the specified exclusions are immediately applied or cease to be applied in running tasks.

*To enable or disable the use of the Trusted Zone in Kaspersky Embedded Systems Security tasks:*

1. In the Application Console tree, open the context menu of the task, for which you want to configure use of the Trusted Zone.
2. Select **Properties**.  
The **Task settings** window opens.
3. In the window that opens, select the **General** tab and do one of the following:
  - To apply the Trusted Zone in the task, select the **Apply Trusted Zone** check box.
  - To disable the Trusted Zone in the task, clear the **Apply Trusted Zone** check box.
4. If you want to configure Trusted Zone settings, click the link in the name of the **Apply Trusted Zone** check box.  
The **Trusted Zone** window opens.  
In the **Trusted Zone** window configure [exclusions](#) and [trusted processes](#) and click **OK**.
5. Click **OK** in the **Task settings** window to save changes.

## Configuring Trusted Zone settings in the Application Console

To configure Trusted Zone settings:

1. [Specify the objects to be skipped](#) by Kaspersky Embedded Systems Security during task execution on the **Exclusions** tab.
2. [Specify the processes to be skipped](#) by Kaspersky Embedded Systems Security during task execution on the **Trusted processes** tab.
3. [Apply the Trusted Zone for the application tasks](#).

#### 4. [Apply the not-a-virus mask.](#)

## Adding an exclusion to the Trusted Zone

To manually add an exclusion to the Trusted Zone via the Application Console:

1. In the Application Console tree, open the context menu of the **Kaspersky Embedded Systems Security** node.
2. Select the **Configure Trusted Zone settings** menu option.  
The **Trusted Zone** window opens.
3. Select the **Exclusions** tab.
4. Specify the objects to be skipped by Kaspersky Embedded Systems Security during scanning and protection:
  - To import preconfigured exclusions, click the **Import** button and, in the window that opens, select the configuration file in XML format stored on your device.  
Exclusions from the XML file will be added to the exclusion list.
  - To manually specify the conditions under which an object will be considered trusted, click the **Add** button and proceed to the next steps.  
The **Exclusion** window opens.
5. If you clicked the **Add** button, in the **Object will not be scanned if the following conditions are met** section, specify the objects that you want to exclude from the protection / scan scope and objects that you want to exclude among detectable objects:
  - If you want to exclude an object from the protection or scan scope:
    - a. Select the **Object to scan**  check box.
    - b. Click the **Edit** button.  
The **Select an object** window opens.
    - c. Specify the object that you want to exclude from the scan scope.

When specifying the objects, you can use names masks (via ? and \* characters) and all types of environment variables. The resolving of environment variables (replacing variables with their values) is performed by Kaspersky Embedded Systems Security when starting a task, or when applying new settings to a running task (not applicable to On-Demand Scan tasks). Kaspersky Embedded Systems Security resolves environment variables under the account used to start the task. For more information on environment variables, refer to the Microsoft Knowledge Base.
  - d. Click **OK**.
  - e. Select the **Apply to subfolders** check box, if you want to exclude all child files and folders of the specified object from the protection or scan scope.
- If you want to specify the name of a detectable object:
  - a. Select the **Objects to detect**  check box.

b. Click the **Edit** button.

The **List of objects to detect** window opens.

c. Specify the name or name mask of the detectable object according to the Virus Encyclopedia classification.

d. Click the **Add** button.

e. Click **OK**.

6. In the **Exclusion usage scope** section, select the check boxes next to the names of the tasks to which the exclusion should be applied.

7. Click **OK**.

The exclusion is displayed in the list on the **Exclusions** tab of the **Trusted Zone** window.

## Adding trusted processes

You can add a process to the list of trusted processes using one of the following methods:

- Select the process from the list of processes running on the protected device.
- Select the executable file of a process regardless of whether the process is currently running.

If the executable file of a process has been modified, Kaspersky Embedded Systems Security excludes this process from the list of trusted processes.

*To add one or more processes to the list of trusted processes:*

1. In the Application Console tree, open the context menu of the **Kaspersky Embedded Systems Security** node.

2. Select the **Configure Trusted Zone settings** menu option.

The **Trusted Zone** window opens.

3. Select the **Trusted processes** tab.

4. Select the **Do not check file backup operations** check box to skip scanning of file read operations.

5. Select the **Do not check file activity of the specified processes** check box to skip file operation scanning for trusted processes.

6. To add processes to the list of trusted processes, do one of the following:

- To import preconfigured trusted processes, click the **Import** button and, in the window that opens, select the configuration file in XML format stored on your device.

Processes from the XML file will be added to the list of trusted processes.

- To manually specify the processes, click the **Add** button and proceed to the next steps.

7. If you clicked the **Add** button, in the button's context menu, select one of the options:

- **Multiple processes.**

In the **Adding trusted processes** window that opens, configure the following:

- a. [Use full process path on disk to consider it trusted](#) 
- b. [Use process file hash to consider it trusted](#) 
- c. Click the **Browse** button to add data based on executable processes.
- d. Select an executable file in the window that opens.

You can only add one executable file at a time. Repeat steps c-d to add other executable files.

- e. Click the **Processes** button to add data based on running processes.
- f. Select processes in the window that opens. To select multiple processes, press and hold the **CTRL** button while selecting.
- g. Click **OK**.

The account under which the Real-Time File Protection task is run must have administrator rights on the device with Kaspersky Embedded Systems Security installed in order to allow viewing of the list of active processes. You can sort processes in the list of active processes by file name, process identifier (PID), or path to the executable file of the process on the protected device. Note, that you can select running processes by clicking the **Processes** button only using the Application Console on a protected device or in the specified host settings via the Kaspersky Security Center.

- **One process based on file name and path.**

In the **Adding a process** window that opens, do the following:

- a. Enter a path to an executable file (including the file name).

When specifying the objects, you can use names masks (via ? and \* characters) and all types of environment variables. The resolving of environment variables (replacing variables with their values) is performed by Kaspersky Embedded Systems Security when starting a task, or when applying new settings to a running task (not applicable to On-Demand Scan tasks). Kaspersky Embedded Systems Security resolves environment variables under the account used to start the task. For more information on environment variables, refer to the Microsoft Knowledge Base.

- b. Click **OK**.

- **One process based on object properties.**

In the **Trusted process adding** window that opens, configure the following:

- a. Click the **Browse** button to select a process.
- b. [Use full process path on disk to consider it trusted](#) 
- c. [Use process file hash to consider it trusted](#) 
- d. Click **OK**.

To add the selected process to the list of trusted processes, at least one trust criterion must be selected.

8. In the **Trusted Zone** window, click the **OK** button.

The selected file or process will be added to the list of trusted processes in the **Trusted Zone** window.

## Applying the not-a-virus mask

The not-a-virus mask makes it possible to skip scanning of legitimate software files and web resources that can be considered harmful. The mask affects the following tasks:

- Real-Time File Protection.
- On-Demand scan.

If the mask is not added to the exclusions list, Kaspersky Embedded Systems Security will apply the actions specified in the task settings for the software or web resources which fall under this category.

*To apply the not-a-virus mask:*

1. In the Application Console tree, open the context menu of the **Kaspersky Embedded Systems Security** node.
2. Select the **Configure Trusted Zone settings** menu option.  
The **Trusted Zone** window opens.
3. Select the **Exclusions** tab.
4. Scroll the list to find the *not-a-virus:\** value.
5. Select the corresponding check box, if it is cleared.
6. Click **OK**.

The new configuration is applied.

## Managing the Trusted Zone via the Web Plug-in

To configure the Trusted Zone via the Web Plug-in:

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the <Policy name> window that opens select the **Application settings** tab.
4. Select the **Supplementary** section.
5. Click **Settings** in the **Trusted Zone** subsection.
6. [Configure the Trusted Zone](#) as required.

# Exploit Prevention

This section contains instructions on how to configure process memory protection settings.

## About Exploit Prevention

Kaspersky Embedded Systems Security provides the ability to protect process memory from exploits. This feature is implemented in the Exploit Prevention component. You can change the component's activity status and configure process memory protection settings.

The component protects process memory from exploits by inserting an external Process Protection Agent ("Agent") in the protected process.

A Process Protection Agent is a dynamically loaded Kaspersky Embedded Systems Security module that is inserted in protected processes to monitor their integrity and reduce the risk of being exploited.

The Agent's operation within the protected process requires starting and stopping the process: the initial loading of the Agent into a process added to the protected process list is only possible if the process is restarted. Additionally, after a process has been removed from the protected process list, the Agent can be unloaded only after the process has been restarted.

The Agent must be stopped to unload it from protected processes: if the Exploit Prevention component is uninstalled, the application freezes the environment and forces the Agent to be unloaded from protected processes. If during uninstallation of the component Agent is inserted in any of the protected processes, you must terminate the affected process. A protected device restart may be required (for example, if system process is being protected).

If evidence of an exploit attack in a protected process is detected, Kaspersky Embedded Systems Security performs one of the following actions:

- Terminates the process if an exploit attempt is made.
- Reports the fact that the process has been compromised.

You can stop process protection using one of the following methods:

- Uninstalling the component.
- Removing the process from the list of protected processes and restarting the process.

## Kaspersky Security Exploit Prevention Service

The Kaspersky Security Exploit Prevention Service is required on the protected device in order for the Exploit Prevention component to be most effective. This service and the Exploit Prevention component are part of the recommended installation. During installation of the service on the protected device, the kavfsw process is created and started. This communicates information about protected processes from the component to the Security Agent.

After the Kaspersky Security Exploit Prevention Service is stopped, Kaspersky Embedded Systems Security continues to protect processes added to the protected process list, is also loaded in newly-added processes, and applies all available exploit prevention techniques to protect process memory.

If your device is running the Windows 10 operating system or later, the application will not continue to protect processes and process memory after the Kaspersky Security Exploit Prevention Service is stopped.

If the Kaspersky Security Exploit Prevention Service is stopped, the application will not receive information about events occurring with protected processes (including information about exploit attacks and the termination of processes). Furthermore, the Agent will not be able to receive information about new protection settings and the addition of new processes to the protected process list.

## Exploit Prevention mode

You can select one of the following modes to configure actions taken to reduce risks that vulnerabilities will be exploited in protected processes:

- **Terminate on exploit:** apply this mode to terminate a process when an exploit attempt is made.

Upon detecting an attempt to exploit a vulnerability in a protected critical operating system process, Kaspersky Embedded Systems Security does not terminate the process, regardless of the mode indicated in the Exploit Prevention component settings.

- **Notify only:** apply this mode to receive information about instances of exploits in protected processes using events in the Security log.

If this mode is selected, Kaspersky Embedded Systems Security creates events to log all attempts to exploit vulnerabilities.

## Managing Exploit Prevention via the Administration Plug-in

In this section, learn how to navigate the Administration Plug-In interface and configure the component settings for one or all protected devices on the network.

### Navigation

Learn how to navigate to the required task settings via the chosen interface.

## Opening policy settings for Exploit Prevention

*To open the Exploit Prevention settings via the Kaspersky Security Center policy:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Policies** tab.
4. Double-click the policy name you want to configure.

5. In the **Properties: <Policy name>** window that opens, select the **Real-Time Computer Protection** section.
6. Click the **Settings** button in the **Exploit prevention** subsection.  
The **Exploit Prevention** window opens.  
Configure Exploit Prevention as required.

## Opening the Exploit Prevention properties window

*To open the properties window for Exploit Prevention:*

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the **Devices** tab.
4. Open the **Properties: <Protected device name>** window in one of the following ways:
  - Double-click the name of the protected device.
  - Select the **Properties** item in the context menu of the protected device.

The **Properties: <Protected device name>** window opens.

5. In the **Applications** section, select **Kaspersky Embedded Systems Security 3.2**.
6. Click the **Properties** button.  
The **Kaspersky Embedded Systems Security 3.2 application settings** window opens.
7. Select the **Real-Time Computer Protection** section.
8. Click the **Settings** button in the **Exploit Prevention** subsection.  
The **Exploit Prevention** window opens.  
Configure Exploit Prevention as required.

## Configuring process memory protection settings

*To configure settings to protect the memory of processes added to the list of protected processes, perform the following actions:*

1. Open the [Exploit Prevention](#) window.
2. In the **Exploit prevention mode** block, configure the following settings:
  - [Prevent vulnerable processes exploit](#) 
  - [Terminate on exploit](#) 

- [Notify only](#)

3. In the **Preventing actions** block, configure the following settings:

- [Notify about abused processes via Terminal Service](#)
- [Prevent vulnerable processes exploit even if Kaspersky Security Service is disabled](#)

4. Click **OK** in the **Exploit Prevention** window.

Kaspersky Embedded Systems Security saves and applies the configured process memory protection settings.

## Adding a process to the protection scope

The Exploit Prevention component protects several processes by default. You can exclude the processes from the protection scope by clearing the corresponding check boxes in the list.

*To add a process to the list of protected processes:*

1. Open the [Exploit Prevention](#) window.
2. On the **Protected processes** tab, click the **Browse** button.  
A Microsoft Windows Explorer window opens.
3. Select the process you want to add to the list.
4. Click the **Open** button.  
The process name is displayed in the line.
5. Click the **Add** button.  
The process will be added to the list of protected processes.
6. Select the added process.
7. Click **Set exploit prevention techniques**.  
The **Exploit prevention techniques** window opens.
8. Select one of the options for applying impact reduction techniques:
  - **Apply all available exploit prevention techniques.**  
If this option is selected, the list cannot be edited. By default, all available techniques are applied to a process.
  - **Apply selected exploit prevention techniques.**  
If this option is selected, you can edit the list of impact reduction techniques applied:
    - a. Select the check boxes next to the techniques that you want to apply to protect the selected process.
    - b. Select or clear the **Apply Attack Surface Reduction technique** check box.
9. Configure settings for the Attack Surface Reduction technique:

- Enter the names of the modules whose launch will be blocked from the protected process in the **Deny modules** field.
- In the **Do not deny modules if launched in the Internet Zone** field, select the check boxes next to the options for which you want to allow modules to be launched:
  - **Internet**
  - **Local intranet**
  - **Trusted URL**
  - **Restricted URL**
  - **Computer**

These settings only apply to Internet Explorer®.

10. Click **OK**.

The process is added to the task protection scope.

## Managing Exploit Prevention via the Application Console

In this section, learn how to navigate the Application Console interface and configure the component settings on a protected device.

### Navigation

Learn how to navigate to the required task settings via the chosen interface.

## Opening the Exploit Prevention general settings

To open the ***Exploit Prevention settings*** window:

1. Expand the **Real-Time File Protection** node in the Application Console tree.
2. Select the **Exploit Prevention** node.
3. In the [Processes protection settings](#) section, click the **Properties** link.  
The **Exploit Prevention settings** window opens.

Configure general settings for Exploit Prevention as required.

## Opening the Exploit Prevention process protection settings

To open the [Processes protection settings](#) window:

1. Expand the **Real-Time File Protection** node in the Application Console tree.
2. Select the **Exploit Prevention** node.

In the [Processes protection settings](#) section, click the **Process protection parameters** link.

The [Processes protection settings](#) window opens.

Configure process protection settings for Exploit Prevention as required.

## Configuring process memory protection settings

To add a process to the list of protected processes:

1. Open the [Exploit Prevention settings](#) window.
2. In the **Exploit prevention mode** block, configure the following settings:
  - [Prevent vulnerable processes exploit](#)
  - [Terminate on exploit](#)
  - [Notify only](#)
3. In the **Preventing actions** block, configure the following settings:
  - [Notify about abused processes via Terminal Service](#)
  - [Prevent vulnerable processes exploit even if Kaspersky Security Service is disabled](#)
4. Click **OK** in the **Exploit Prevention settings** window.

Kaspersky Embedded Systems Security saves and applies the configured process memory protection settings.

## Adding a process to the protection scope

The Exploit Prevention component protects several processes by default. You can uncheck the processes that you don't want to protect in the list of protected processes.

To add a process to the list of protected processes:

1. Open the [Processes protection settings](#) window.
2. To add a process to protect it from abuse and to reduce the potential impact of an exploit, perform the following actions:
  - a. Click the **Browse** button.

The standard Microsoft Windows **Open** window opens.
  - b. In the window that opens select a process you want to add to the list.

c. Click the **Open** button.

d. Click the **Add** button.

The process will be added to the list of protected processes.

3. Select a process in the list.

4. The current configuration is displayed on the [Processes protection settings](#) tab:

- **Process name.**
- **Is being executed.**
- **Exploit prevention techniques applied.**
- **Attack Surface Reduction settings.**

5. To modify the exploit prevention techniques that are applied to the process, select the **Deny modules for loading** tab.

6. Select one of the options for applying impact reduction techniques:

- **Apply all available exploit prevention techniques.**

If this option is selected, the list cannot be edited. By default, all available techniques are applied to a process.

- **Apply listed exploit prevention techniques for the process.**

If this option is selected, you can edit the list of impact reduction techniques applied:

- a. Select the check boxes next to the techniques that you want to apply to protect the selected process.

7. Configure settings for the Attack Surface Reduction technique:

- Enter the names of the modules whose launch will be blocked from the protected process in the **Deny modules** field.
- In the **Do not deny modules if launched in the Internet Zone** section, select the check boxes next to the options for which you want to allow modules to be launched:

- **Internet**
- **Local intranet**
- **Trusted URL**
- **Restricted sites**
- **Computer**

These settings only apply to Internet Explorer®.

8. Click **Save**.

The process is added to the task protection scope.

## Managing Exploit Prevention via the Web Plug-in

In this section, learn how to navigate the Web Plug-in interface and configure the component settings on a protected device.

### Configuring process memory protection settings

*To configure settings to protect the memory of processes added to the list of protected processes, perform the following actions:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.
3. In the **<Policy name>** window that opens select the **Application settings** tab.
4. Select the **Real-time computer protection** section.
5. Click **Settings** in the **Exploit Prevention** subsection.
6. Open the **Exploit Prevention settings** tab.
7. In the **Exploit prevention mode** block, configure the following settings:
  - [Prevent vulnerable processes exploit](#)
  - [Terminate on exploit](#)
  - [Notify only](#)
8. In the **Preventing actions** block, configure the following settings:
  - [Notify about abused processes via Terminal Service](#)
  - [Prevent vulnerable processes exploit even if Kaspersky Security Service is disabled](#)
9. Click **OK** in the **Exploit Prevention** window.

Kaspersky Embedded Systems Security saves and applies the configured process memory protection settings.

### Adding a process to the protection scope

*To configure settings to protect the memory of processes added to the list of protected processes, perform the following actions:*

1. In the main window of the Web Console, select **Devices** → **Policies & profiles**.
2. Click the policy name you want to configure.

3. In the <Policy name> window that opens select the **Application settings** tab.
  4. Select the **Real-time computer protection** section.
  5. Click **Settings** in the **Exploit Prevention** subsection.
  6. Open the **Protected processes** tab.
  7. Click the **Add** button.
  8. The **Exploit prevention techniques** window opens.
  9. Specify the process name.
  10. Select one of the options for applying impact reduction techniques:
    - **Apply all available exploit prevention techniques.**  
If this option is selected, the list cannot be edited. By default, all available techniques are applied to a process.
    - **Apply selected exploit prevention techniques.**  
If this option is selected, you can edit the list of impact reduction techniques applied:
      - a. Select the check boxes next to the techniques that you want to apply to protect the selected process.
      - b. Select or clear the **Apply Attack Surface Reduction technique** check box.
  11. Configure settings for the Attack Surface Reduction technique:
    - Enter the names of the modules whose launch will be blocked from the protected process in the **Deny modules** field.
    - In the **Do not deny modules if launched in the Internet Zone** field, select the check boxes next to the options for which you want to allow modules to be launched:
      - **Internet**
      - **Local intranet**
      - **Trusted URL**
      - **Restricted URL**
      - **Computer**
- These settings only apply to Internet Explorer®.
12. Click **OK**.

The process is added to the task protection scope.

## Exploit prevention techniques

Exploit prevention technique	Description
Data Execution Prevention (DEP)	Data execution prevention blocks execution of arbitrary code in protected areas of memory.
Address Space Layout Randomization (ASLR)	Changes to the layout of data structures in the address space of the process.
Structured Exception Handler Overwrite Protection (SEHOP)	Replacement of exception records or replacement of the exception handler.
Null Page Allocation	Prevention of redirecting the null pointer.
LoadLibrary Network Call Check (Anti ROP)	Protection against loading DLLs from network paths.
Executable Stack (Anti ROP)	Blocking of unauthorized execution of areas of the stack.
Anti RET Check (Anti ROP)	Check that the CALL instruction is invoked safely.
Anti Stack Pivoting (Anti ROP)	Protection against relocation of the ESP stack pointer to an executable address.
Simple Export Address Table Access Monitor (EAT Access Monitor & EAT Access Monitor via Debug Register)	Protection of read access to the export address table for kernel32.dll, kernelbase.dll, and ntdll.dll
Heap Spray Allocation (Heapspray)	Protection against allocating memory to execute malicious code.
Execution Flow Simulation (Anti Return Oriented Programming)	Detection of potentially dangerous chains of instructions (potential ROP gadget) in the Windows API component.
IntervalProfile Calling Monitor (Ancillary Function Driver Protection (AFDP))	Protection against escalation of privileges through a vulnerability in the AFD driver (execution of arbitrary code in ring 0 through a QueryIntervalProfile call).
Attack Surface Reduction (ASR)	Blocking the start of vulnerable add-ins via the protected process.
Anti Process Hollowing (Hollowing)	Protection against creating and executing the malicious copies of trusted processes.
Anti AtomBombing (APC)	Global atom table exploit via Asynchronous Procedure Calls (APC).
Anti CreateRemoteThread (RThreadLocal)	Another process has created a thread in protected process.
Anti CreateRemoteThread (RThreadRemote)	Protected process has created a thread in another process.

## Integrating with third-party systems

This section describes integration of Kaspersky Embedded Systems Security with third-party features and technologies.

## Performance counters for System Monitor

This section contains information about performance counters for the Microsoft Windows System Monitor that are registered by Kaspersky Embedded Systems Security during installation.

## About Kaspersky Embedded Systems Security performance counters

The Performance Counters component is included in the installed components of Kaspersky Embedded Systems Security by default. Kaspersky Embedded Systems Security registers its own performance counters for the Microsoft Windows System Monitor during installation.

Using Kaspersky Embedded Systems Security counters, you can monitor the application's performance while the Real-Time Computer Protection tasks are running. You can identify bottlenecks when it is running with other applications and resource shortages. You can diagnose Kaspersky Embedded Systems Security crashes and identify undesirable settings.

You can view Kaspersky Embedded Systems Security performance counters by opening the **Performance** console in the **Administration** section of Windows Control Panel.

The following sections list definitions of counters, recommended intervals for taking readings, threshold values, and recommended Kaspersky Embedded Systems Security settings if the counter values exceed the thresholds.

## Total number of requests denied

Total number of requests denied

<b>Name</b>	Total number of requests denied
<b>Definition</b>	<p>Total number of object processing requests made by the file interception driver and not accepted by the application processes; counted from the time Kaspersky Embedded Systems Security was last started.</p> <p>The application skips objects for which processing requests are denied by Kaspersky Embedded Systems Security processes.</p>
<b>Purpose</b>	<p>This counter can help you detect:</p> <ul style="list-style-type: none"><li>• Reduced Real-Time Computer Protection because Kaspersky Embedded Systems Security processes are overworked.</li><li>• Interruption of Real-Time Computer Protection because of failures of file interception dispatchers.</li></ul>
<b>Normal / threshold value</b>	0 / 1.
<b>Recommended</b>	1 hour.

## reading interval

### Recommendations for configuration if value exceeds the threshold

The number of denied processing requests corresponds to the number of skipped objects.

The following situations are possible depending on counter behavior:

- The counter shows several requests denied over an extended period of time: all Kaspersky Embedded Systems Security processes were fully loaded, so Kaspersky Embedded Systems Security could not scan objects. To avoid skipping objects, increase the number of application processes for the Real-Time Computer Protection tasks. You can use such Kaspersky Embedded Systems Security settings as **Number of processes for real-time protection**.
- The number of request denied significantly exceeds the critical threshold and is growing quickly: the file interception dispatcher has crashed. Kaspersky Embedded Systems Security is not scanning objects when they are accessed. Restart Kaspersky Embedded Systems Security.

## Total number of requests skipped

Total number of requests skipped

<b>Name</b>	Total number of requests skipped
<b>Definition</b>	<p>The total number of object processing requests made by the file interception driver that have been received by Kaspersky Embedded Systems Security and have not generated events indicating that processing is complete; this number is counted starting from the moment when the application was last started.</p> <p>If an object processing request is accepted by one of the work processes but does not send an event indicating that processing is complete, the driver will transfer the request to another process and the value of the <b>Total Number of Skipped Requests</b> counter will increase by 1. If the driver has gone through all of the work processes and none of them has accepted the processing request (all were busy) or has not sent an event indicating that processing is complete, Kaspersky Embedded Systems Security will skip the object, so the value of the <b>Total Number of Skipped Requests</b> counter will increase by 1.</p>
<b>Purpose</b>	This counter enables you to detect drops in performance due to failures of file interception dispatchers.
<b>Normal / threshold value</b>	0 / 1
<b>Recommended reading interval</b>	1 hour
<b>Recommendations for configuration if value exceeds the threshold</b>	<p>If the counter is anything other than zero, this means that one or more file interception dispatcher streams have frozen and are down. The counter value corresponds to the number of streams currently down.</p> <p>If the scan speed is not satisfactory, restart Kaspersky Embedded Systems Security to restore the off-line streams.</p>

## Number of requests not processed because of lack of system resources

Number of requests not processed because of lack of system resources

<b>Name</b>	Number of requests not processed due to a lack of resources.
<b>Definition</b>	Total number of requests from the file interception driver which were not processed because of a lack of system resources (for example, RAM); counted from the time Kaspersky Embedded Systems Security was last started.  Kaspersky Embedded Systems Security skips object processing requests that are not processed by the file interception driver.
<b>Purpose</b>	This counter can be used to detect and eliminate potentially lower quality in Real-Time Computer Protection that occurs because of low system resources.
<b>Normal / threshold value</b>	0 / 1.
<b>Recommended reading interval</b>	1 hour.
<b>Recommendations for configuration if value exceeds the threshold</b>	If the counter value is anything other than zero, Kaspersky Embedded Systems Security work processes need more RAM to process requests.  Active processes of other applications may be using all available RAM.

## Number of requests sent to be processed

Number of requests sent to be processed

<b>Name</b>	Number of requests sent to be processed.
<b>Definition</b>	The number of objects waiting to be processed by work processes.
<b>Purpose</b>	This counter can be used to monitor the load on Kaspersky Embedded Systems Security work processes and the overall level of file activity on the protected device.
<b>Normal / threshold value</b>	The counter may vary depending on the level of file activity on the protected device.
<b>Recommended reading interval</b>	1 minute
<b>Recommendations for configuration if value exceeds the threshold</b>	N/A

## Average number of file interception dispatcher streams

Average number of file interception dispatcher streams

<b>Name</b>	Average number of file interception dispatcher streams.
<b>Definition</b>	The number of file interception dispatcher streams in one process and the average for all processes currently involved in the Real-Time Computer Protection tasks.
<b>Purpose</b>	This counter can be used to detect and eliminate a potential reduction in Real-Time Computer Protection due to a full load on Kaspersky Embedded Systems Security processes.
<b>Normal / threshold value</b>	Varies / 40
<b>Recommended</b>	1 minute

## reading interval

### Recommendations for configuration if value exceeds the threshold

Up to 60 file interception dispatcher streams can be created in each work process. If the counter approaches 60, there is a risk that none of the work processes will be able to process the next request in the queue from the file interception driver and Kaspersky Embedded Systems Security will skip the object.

Increase the number of Kaspersky Embedded Systems Security processes for the Real-Time Computer Protection tasks. You can use such Kaspersky Embedded Systems Security settings as **Number of processes for real-time protection**.

## Maximum number of file interception dispatcher streams

Maximum number of file interception dispatcher streams

<b>Name</b>	Maximum number of file interception dispatcher streams.
<b>Definition</b>	The number of file interception dispatcher streams in one process and the maximum for all processes currently involved in the Real-Time Computer Protection tasks.
<b>Purpose</b>	This counter enables you to detect and eliminate drops in performance because of uneven distribution of loads in running processes.
<b>Normal / threshold value</b>	Varies / 40
<b>Recommended reading interval</b>	1 minute
<b>Recommendations for configuration if value exceeds the threshold</b>	If the value of this counter significantly and continuously exceeds the <b>Average number of file interception dispatcher streams</b> counter, Kaspersky Embedded Systems Security is distributing the load to running processes unevenly. Restart Kaspersky Embedded Systems Security.

## Number of elements in the infected objects queue

Number of elements in the infected objects queue

<b>Name</b>	Number of elements in the infected objects queue.
<b>Definition</b>	Number of infected objects currently waiting to be processed (disinfected or deleted).
<b>Purpose</b>	This counter can help you detect: <ul style="list-style-type: none"><li>• Interruption of Real-Time Computer Protection due to potential failures of file interception dispatchers.</li><li>• Overloading of processes due to uneven distribution of processor time among different work processes and Kaspersky Embedded Systems Security.</li><li>• Virus outbreaks.</li></ul>
<b>Normal / threshold value</b>	This value may be something other than zero while Kaspersky Embedded Systems Security is processing infected or probably infected objects but will return to zero after processing is finished / The value remains non-zero for an extended period of time.

<b>Recommended reading interval</b>	1 minute
<b>Recommendations for configuration if value exceeds the threshold</b>	<p>If the value of the counter does not return to zero for an extended period of time:</p> <ul style="list-style-type: none"> <li>• Kaspersky Embedded Systems Security is not processing objects (the file interception dispatcher may have crashed). Restart Kaspersky Embedded Systems Security.</li> <li>• There may be insufficient processor time to process the objects. Make sure Kaspersky Embedded Systems Security receives additional processor time (by reducing other applications' load on the protected device, for example).</li> <li>• There has been a virus outbreak.</li> </ul> <p>A large number of infected or probably infected objects in the Real-Time File Protection task is also a sign of a virus outbreak. You can view information about the number of detected objects in the task statistics or task logs.</p>

## Number of objects processed per second

Number of objects processed per second

<b>Name</b>	Number of objects processed per second.
<b>Definition</b>	Number of objects processed divided by the amount of time that it took to process those objects (calculated over equal time intervals).
<b>Purpose</b>	This counter reflects the speed of object processing; it can be used to detect and eliminate low points in protected device performance that occur because of insufficient processor time being allotted to Kaspersky Embedded Systems Security processes or errors in Kaspersky Embedded Systems Security operation.
<b>Normal / threshold value</b>	Varies / No.
<b>Recommended reading interval</b>	1 minute.
<b>Recommendations for configuration if value exceeds the threshold</b>	<p>The values of this counter depend on the values set in Kaspersky Embedded Systems Security settings and the load on the protected device from other applications' processes.</p> <p>Observe the average counter value over an extended period of time. If the general counter value decreases, one of the following situations is possible:</p> <ul style="list-style-type: none"> <li>• Kaspersky Embedded Systems Security processes do not have enough processor time to process the objects. Make sure Kaspersky Embedded Systems Security receives additional processor time (by reducing other applications' load on the protected device, for example).</li> <li>• Kaspersky Embedded Systems Security has experienced an error (several streams are idle). Restart Kaspersky Embedded Systems Security.</li> </ul>

## Kaspersky Embedded Systems Security SNMP counters and traps

This section contains information about Kaspersky Embedded Systems Security counters and traps.

## About Kaspersky Embedded Systems Security SNMP counters and traps

If you included SNMP Counters and Traps in the set of anti-virus components to be installed, you can view Kaspersky Embedded Systems Security counters and traps using Simple Network Management Protocol (SNMP).

To view Kaspersky Embedded Systems Security counters and traps from the administrator's workstation, start SNMP Service on the protected device and start SNMP and SNMP Trap Services on the administrator's workstation.

## Kaspersky Embedded Systems Security SNMP counters

This section contains tables with a description of the settings for Kaspersky Embedded Systems Security SNMP counters.

### Performance counters

Performance counters

Counter	Definition
currentRequestsAmount	<a href="#">Number of requests sent to be processed</a>
currentInfectedQueueLength	<a href="#">Number of elements in the infected objects queue</a>
currentObjectProcessingRate	<a href="#">Number of objects processed per second</a>
currentWorkProcessesNumber	Current number of work processes used by Kaspersky Embedded Systems Security

### Quarantine counters

Quarantine counters

Counter	Definition
totalObjects	Number of objects currently in Quarantine
totalSuspiciousObjects	Number of probably infected objects currently in Quarantine
currentStorageSize	Total amount of data in Quarantine (MB)

### Backup counter

Backup counter

Counter	Definition
currentBackupStorageSize	Total amount of data in Backup (MB)

## General counters

### General counters

Counter	Definition
lastCriticalAreasScanAge	The period since the last complete scan of the protected device's critical areas (time elapsed in seconds since the last Critical Areas Scan task was completed).
licenseExpirationDate	License expiration date. If an active and additional key have been added, the date of expiry of the license associated with the additional key is displayed.
currentApplicationUptime	The amount of time that Kaspersky Embedded Systems Security has been running since it was last started, in hundredths of seconds.

## Update counter

### Update counter

Counter	Definition
avBasesAge	"Age" of databases (time elapsed in hundredths of seconds since the creation date of the latest installed database updates).

## Real-Time File Protection counters

### Real-Time File Protection counters

Counter	Definition
totalObjectsProcessed	Total number of objects scanned since the time the last Real-Time File Protection task was run
totalInfectedObjectsFound	Total number of infected and other objects detected since the time the last Real-Time File Protection task was run
totalSuspiciousObjectsFound	Total number of probably infected objects detected since the time the last Real-Time File Protection task was run
totalVirusesFound	Total number of objects detected since the time the Real-Time File Protection task was last run
totalObjectsQuarantined	Total number of infected, probably infected and other objects which were placed into Quarantine by Kaspersky Embedded Systems Security; calculated from the time the Real-Time File Protection task was last started
totalObjectsNotQuarantined	Total number of infected or probably infected objects Kaspersky Embedded Systems Security attempted to quarantine but was unable to; calculated from the time the Real-Time File Protection task was last started
totalObjectsDisinfected	Total number of infected objects which were disinfected by Kaspersky Embedded Systems Security; calculated from the time the Real-Time File Protection task was last started

totalObjectsNotDisinfected	Total number of infected and other objects which Kaspersky Embedded Systems Security attempted to disinfect but was unable to; calculated from the time Real-Time File Protection task was last started
totalObjectsDeleted	Total number of infected, probably infected and other objects which were deleted by Kaspersky Embedded Systems Security; calculated from the time the Real-Time File Protection task was last started
totalObjectsNotDeleted	Total number of infected, probably infected and other objects which Kaspersky Embedded Systems Security attempted to delete but was unable to; calculated from the time Real-Time File Protection task was last started
totalObjectsBackedUp	Total number of infected objects and other which were placed into Backup by Kaspersky Embedded Systems Security; calculated from the time the Real-Time File Protection task was last started
totalObjectsNotBackedUp	Total number of infected objects and other which Kaspersky Embedded Systems Security attempted to place into Backup but was unable to; calculated from the time Real-Time File Protection task was last started

## Kaspersky Embedded Systems Security SNMP traps and their options

The SNMP traps options in Kaspersky Embedded Systems Security are summarized as follows:

- eventThreatDetected: an object has been detected.  
The trap has the following options:
  - eventDateAndTime
  - eventSeverity
  - computerName
  - userName
  - objectName
  - threatName
  - detectType
  - detectCertainty
- eventBackupStorageSizeExceeds: maximum Backup size exceeded. The total amount of data in Backup exceeds the value specified by **Maximum Backup size (MB)**. Kaspersky Embedded Systems Security continues to back up infected objects.

The trap has the following options:

- eventDateAndTime
- eventSeverity
- eventSource

- eventThresholdBackupStorageSizeExceeds: Backup free space threshold reached. The amount of free space in Backup is less than or equal to the value specified by **Threshold value for space available (MB)**. Kaspersky Embedded Systems Security continues to back up infected objects.

The trap has the following options:

- eventDateAndTime
  - eventSeverity
  - eventSource
- eventQuarantineStorageSizeExceeds: maximum Quarantine size exceeded. The total size of data in Quarantine has exceeded the value specified by the **Maximum Quarantine size (MB)**. Kaspersky Embedded Systems Security continues to quarantine probably infected objects.

The trap has the following options:

- eventDateAndTime
  - eventSeverity
  - eventSource
- eventThresholdQuarantineStorageSizeExceeds: Quarantine free space threshold reached. The amount of free size in Quarantine assigned by the **Threshold value for space available (MB)** is equal to or less than the specified value. Kaspersky Embedded Systems Security continues to back up infected objects.

The trap has the following options:

- eventDateAndTime
  - eventSeverity
  - eventSource
- eventObjectNotQuarantined: Quarantine error.

The trap has the following options:

- eventSeverity
  - eventDateAndTime
  - eventSource
  - userName
  - computerName
  - objectName
  - storageObjectNotAddedEventReason
- eventObjectNotBackuped: Error while saving an object copy in Backup.

The trap has the following options:

- eventSeverity

- eventDateAndTime
  - eventSource
  - objectName
  - userName
  - computerName
  - storageObjectNotAddedEventReason
- eventQuarantineInternalError: Quarantine internal error.  
The trap has the following options:
    - eventSeverity
    - eventDateAndTime
    - eventSource
    - eventReason
- eventBackupInternalError: Backup error.  
The trap has the following options:
    - eventSeverity
    - eventDateAndTime
    - eventSource
    - eventReason
- eventAVBasesOutdated: Anti-virus database is out of date. Number of days since the last time the Database Update task (local task, or group task, or task for sets of protected devices) was run.  
The trap has the following options:
    - eventSeverity
    - eventDateAndTime
    - eventSource
    - days
- eventAVBasesTotallyOutdated: Anti-virus database is obsolete. Number of days since the last time the Database Update task (local task, or group task, or task for sets of protected devices) was run.  
The trap has the following options:
    - eventSeverity
    - eventDateAndTime
    - eventSource

- days
- eventApplicationStarted: Kaspersky Embedded Systems Security is running.  
The trap has the following options:
  - eventSeverity
  - eventDateAndTime
  - eventSource
- eventApplicationShutdown: Kaspersky Embedded Systems Security is stopped.  
The trap has the following options:
  - eventSeverity
  - eventDateAndTime
  - eventSource
- eventCriticalAreasScanWasntPerformForALongTime: Critical areas have not been scanned for a long time. Number of days since the last time the Critical Areas Scan task completed.  
The trap has the following options:
  - eventSeverity
  - eventDateAndTime
  - eventSource
  - days
- eventLicenseHasExpired: License has expired.  
The trap has the following options:
  - eventSeverity
  - eventDateAndTime
  - eventSource
- eventLicenseExpiresSoon: License expires soon. Calculated as the number of days until the expiration date for the license.  
The trap has the following options:
  - eventSeverity
  - eventDateAndTime
  - eventSource
  - days
- eventTaskInternalError: Task completion error.

The trap has the following options:

- eventSeverity
  - eventDateAndTime
  - eventSource
  - errorCode
  - knowledgeBaseId
  - taskName
- eventUpdateError: Error while running the update task.

The trap has the following options:

- eventSeverity
- eventDateAndTime
- taskName
- updaterErrorEventReason

## Kaspersky Embedded Systems Security SNMP traps options descriptions and possible values

Descriptions of the traps options and their possible values are given below:

- eventDateAndTime: event date and time.
- eventSeverity: importance level.

The option can take the following values:

- critical (1) – critical
  - warning (2) – warning
  - info (3) – informational
- userName: user name (for example, the name of a user that attempted to access an infected file).
  - computerName: protected device name (for example, the name of a protected device from which a user attempted to access an infected file).
  - eventSource: functional component that generated the event.

The option can take the following values:

- unknown (0) – functional component not known
- quarantine (1) – Quarantine

- backup (2) – Backup
- reporting (3) – task logs
- updates (4) – Update
- realTimeProtection (5) – Real-Time File Protection
- onDemandScanning (6) – On-Demand Scan
- product (7) – event related to operation of Kaspersky Embedded Systems Security as a whole rather than operation of individual components
- systemAudit (8) – system audit log

- eventReason: event trigger: what triggered the event.

The option can take the following values:

- reasonUnknown (0) – reason is unknown.
- reasonInvalidSettings (1) – only for Backup and Quarantine events, displayed if Quarantine or Backup is unavailable (insufficient access permissions or an invalid folder is specified in the Quarantine settings -- for example, the a network path is specified). In this case, Kaspersky Embedded Systems Security will use the default Backup or Quarantine folder.
- objectName: an object name (for example, the name of the file where the virus was detected).
- threatName: The name of the object according to the Virus Encyclopedia classification. This name is included in the full name that Kaspersky Embedded Systems Security returns on detecting an object. You can view the full name of a detected object in the task log.

- detectType: type of object detected.

The option can take the following values:

- undefined (0) – undefined
- virware – classic viruses and network worms
- trojware – Trojans
- malware – other malicious applications
- adware – advertising software
- pornware – pornographic software
- riskware – legitimate applications that may be used by intruders to damage the user's device or personal data
- detectCertainty: certainty level for threat detection.

The option can take the following values:

- Suspicion (probably infected) – Kaspersky Embedded Systems Security has detected a partial match between a section of object code and a known section of malicious code.

- Sure (infected) – Kaspersky Embedded Systems Security has detected a complete match between a section of code in the object and a known section of malicious code.
- days: number of days (for example, the number of days until the license expiration date).
- errorCode: an error code.
- knowledgeBaselId: address of a knowledge base article (for example, address of an article that explains a particular error).
- taskName: a task name.
- updaterErrorEventReason: the reason for the update error.

The option can take the following values:

- reasonUnknown(0) – reason is unknown.
- reasonAccessDenied – access denied.
- reasonUrlsExhausted – the list of update sources is exhausted.
- reasonInvalidConfig – invalid configuration file.
- reasonInvalidSignature – invalid signature.
- reasonCantCreateFolder – folder cannot be created.
- reasonFileOperError – file error.
- reasonDataCorrupted – object is corrupted.
- reasonConnectionReset – connection reset.
- reasonTimeOut – connection timeout exceeded.
- reasonProxyAuthError – proxy authentication error.
- reasonServerAuthError – server authentication error.
- reasonHostNotFound – device not found.
- reasonServerBusy – server unavailable.
- reasonConnectionError – connection error.
- reasonModuleNotFound – object not found.
- reasonBlstCheckFailed(16) – error while checking the key denylist. It is possible that database updates were being published at the time of the update; please repeat the update in a few minutes.
- storageObjectNotAddedEventReason: the reason why the object was not backed up or quarantined.

The option can take the following values:

- reasonUnknown (0) – reason is unknown.

- reasonStorageInternalError – database error; Kaspersky Embedded Systems Security must be restored.
- reasonStorageReadOnly – database is read-only; Kaspersky Embedded Systems Security must be restored.
- reasonStorageIOError – input-output error: a) Kaspersky Embedded Systems Security is corrupted, Kaspersky Embedded Systems Security must be restored; b) disk with Kaspersky Embedded Systems Security files is corrupted.
- reasonStorageCorrupted – storage is corrupted; Kaspersky Embedded Systems Security must be restored.
- reasonStorageFull – database is full; free disk space is required.
- reasonStorageOpenError – database file could not be opened; Kaspersky Embedded Systems Security must be restored.
- reasonStorageOSFeatureError – some operating system features do not correspond to Kaspersky Embedded Systems Security requirements.
- reasonObjectNotFound – object being placed in Quarantine does not exist on the disk.
- reasonObjectAccessError – insufficient permissions to use Backup API: the account being used to perform the operation does not have Backup Operator permissions.
- reasonDiskOutOfSpace – not enough space on the disk.

## Integrating with WMI

Kaspersky Embedded Systems Security supports integration with Windows Management Instrumentation (WMI): you can use client systems that use WMI to receive data via the Web-Based Enterprise Management (WBEM) standard in order to receive information about the status of Kaspersky Embedded Systems Security and its components.

When Kaspersky Embedded Systems Security is installed, it registers a proprietary module on the system to create a Kaspersky Embedded Systems Security namespace on the protected device. A Kaspersky Embedded Systems Security namespace lets you work with Kaspersky Embedded Systems Security classes and instances and their properties.

The values of some instance properties depend on task types.

A *non-periodic task* is an application task that is not time-limited and can either be constantly running or stopped. Such tasks have no execution progress. The task results are logged continuously while the task is running as single events (for example, detection of an infected object by any Real-Time Computer Protection tasks). This type of tasks is managed via Kaspersky Security Center policies.

A *periodic task* is an application task that is time-limited and has execution progress displayed as a percentage. The task results are generated when task is complete and are represented as a single item or changed application state (for example, completed application database update, generated configuration files for rule generation tasks). Several periodic tasks of the same type can run on a single protected device simultaneously (e.g. three On-Demand scan tasks with different scan scopes). Periodic tasks can be managed via Kaspersky Security Center as group tasks.

If you use tools to generate WMI namespace queries and receive dynamic data from WMI namespaces on your corporate network, you will be able to receive information about the current application state (see the table below).

Instance property	Description	Values
ProductName	Name of the installed application.	Full name of application without version number.
ProductVersion	Full version of the installed application.	Full application version number, including the build number.
InstalledPatches	Set of display names for installed patches.	List of critical fixes installed for the application.
IsLicenseInstalled	Application activation status.	Status of the key used to activate the application. Possible values: <ul style="list-style-type: none"> <li>• False - A license key has not been added to the application.</li> <li>• True - A license key has been added to the application.</li> </ul>
LicenseDaysLeft	Shows how many days are left before a current license expiration.	Number of days remaining before expiration of the current license. Possible non-positive values: <ul style="list-style-type: none"> <li>• 0 - License has expired.</li> <li>• -1 - Unable to get information on the current key or the specified key cannot be used to activate the application (for example, it is blocked based on key denylist).</li> </ul>
AVBasesDatetime	Timestamp for the current anti-virus database version.	Date and time of the creation of the anti-virus databases currently in use. If the installed application does not use anti-virus databases, then the field has the value "Not installed".
IsExploitPreventionEnabled	Status of the Exploit Prevention component.	Status of the Exploit Prevention component. Possible values: <ul style="list-style-type: none"> <li>• True - The Exploit Prevention component is enabled and providing protection.</li> <li>• False - The Exploit Prevention component is not providing protection. For example: disabled, not installed, the License Agreement has been violated.</li> </ul>
ProtectionTasksRunning	Set of protection tasks that are currently running.	List of protection, control, and monitoring tasks currently running. This field should account for all running non-periodic tasks. If no non-periodic task is running, the field has the value "None".
IsAppControlRunning	Status of the Applications Launch Control task.	Status of the Applications Launch Control task.

		<ul style="list-style-type: none"> <li>• True - The Applications Launch Control task is currently running.</li> <li>• False - The Applications Launch Control is not currently running or the Applications Launch Control component is not installed.</li> </ul>
AppControlMode	Applications Launch Control task mode.	<p>Describes the current status of the Applications Launch Control component, and describes the selected mode for the corresponding task.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>• Active - <b>Active</b> mode is selected in the task settings.</li> <li>• Statistics Only - <b>Statistics only</b> mode is selected in the task settings.</li> <li>• Not installed - The Applications Launch Control component is not installed.</li> </ul>
AppControlRulesNumber	Total number of applications launch control rules.	The number of rules currently specified in the Applications Launch Control task settings.
AppControlLastBlocking	The timestamp for the last application launch blocking by the Applications Launch Control task in any mode.	<p>Date and time when the Applications Launch Control component last blocked the launch of an application. This field includes all blocked applications, regardless of the task mode.</p> <p>If no instances of blocked application launches are registered at the time the WMI query is processed, the field is assigned the value "None".</p>
PeriodicTasksRunning	Set of periodic tasks that are currently running.	<p>List of On-Demand Scan, Update, and inventory-taking tasks currently running. This field should include all running periodic tasks.</p> <p>If no periodic tasks are currently running, then the field has the value "None".</p>
ConnectionState	Status of the connection between the WMI Provider component and the Kaspersky Security Service (KAVFS).	<p>Information about the status of the connection between the WMI Provider component and the Kaspersky Security Service.</p> <p>Possible values:</p> <ul style="list-style-type: none"> <li>• Success - The connection was successfully established: the WMI client can receive the application status.</li> <li>• Failed. Error Code: &lt;code&gt; - The connection could not be established due to an error with the specified code.</li> </ul>

This data represents instance properties KasperskySecurity\_ProductInfo.ProductName=Kaspersky Embedded Systems Security, where:

- KasperskySecurity\_ProductInfo is the name of the Kaspersky Embedded Systems Security class
- .ProductName=Kaspersky Embedded Systems Security are the Kaspersky Embedded Systems Security key properties

The instance is created in the ROOT\Kaspersky\Security namespace.

# Working with Kaspersky Embedded Systems Security from the command line

This section describes working with Kaspersky Embedded Systems Security from the command line.

## Commands

You can perform basic Kaspersky Embedded Systems Security management commands from the command line of the protected device using the Command Line utility component, which is included in the Kaspersky Embedded Systems Security software components group.

You can use commands to manage only those functions accessible to you based on the permissions assigned to you in Kaspersky Embedded Systems Security.

Certain Kaspersky Embedded Systems Security commands are executed in the following modes:

- Synchronous mode: control returns to the Console only after the command is complete.
- Asynchronous mode: control returns to the Console immediately after the command is started.

*To interrupt a command being executed in synchronous mode,*

press the **Ctrl+C** keyboard shortcut.

Follow these rules when entering Kaspersky Embedded Systems Security commands:

- Enter modifiers and commands using upper and lower case.
- Separate modifiers with a space.
- If the path of a file/folder specified as a value includes a space, enclose the path in quotes, for example: "C:\TEST\test cpp.exe".
- If necessary, you can use wildcards in the filename or path, for example: "C:\Temp\Temp\*\", "C:\Temp\Temp???.doc", "C:\Temp\Temp\*.doc".

You can use the command line to perform every operation required for management and administration of Kaspersky Embedded Systems Security (see the table below).

Kaspersky Embedded Systems Security commands

Command	Description
<a href="#">KAVSHELL</a> <a href="#">APPCONTROL</a>	Update the rule list according to the selected import rule.
<a href="#">KAVSHELL</a> <a href="#">APPCONTROL</a> <a href="#">/CONFIG</a>	Set the operating mode of the Applications Launch Control task
<a href="#">KAVSHELL</a> <a href="#">APPCONTROL</a> <a href="#">/GENERATE</a>	Start the Rule Generator for Applications Launch Control task.
<a href="#">KAVSHELL VACUUM</a>	Defragment Kaspersky Embedded Systems Security log files.

<code>KAVSHELL PASSWORD</code>	Manage password protection settings.
<a href="#"><u><code>KAVSHELL HELP</code></u></a>	Display Kaspersky Embedded Systems Security command help.
<a href="#"><u><code>KAVSHELL START</code></u></a>	Start the Kaspersky Security Service.
<a href="#"><u><code>KAVSHELL STOP</code></u></a>	Stop the Kaspersky Security Service.
<a href="#"><u><code>KAVSHELL SCAN</code></u></a>	Create and start a temporary On-Demand Scan task with the scan scope and security settings specified by the command-line options.
<a href="#"><u><code>KAVSHELL SCANCRITICAL</code></u></a>	Start the Critical Areas Scan local system task.
<a href="#"><u><code>KAVSHELL TASK</code></u></a>	Start, pause / resume, stop the specified task asynchronously, returns the current task status / statistics.
<a href="#"><u><code>KAVSHELL RTP</code></u></a>	Start or stop all Real-Time Computer Protection tasks.
<a href="#"><u><code>KAVSHELL UPDATE</code></u></a>	Start the Database Update task with the settings specified by the command-line options.
<a href="#"><u><code>KAVSHELL ROLLBACK</code></u></a>	Roll back the databases to the previous version.
<a href="#"><u><code>KAVSHELL LICENSE</code></u></a>	Add or delete the keys. Display information about the added keys.
<a href="#"><u><code>KAVSHELL TRACE</code></u></a>	Enable or disable tracing. Manage tracing settings.
<a href="#"><u><code>KAVSHELL DUMP</code></u></a>	Enable or disable creation of dump files when Kaspersky Embedded Systems Security processes terminate abnormally.
<a href="#"><u><code>KAVSHELL IMPORT</code></u></a>	Import general Kaspersky Embedded Systems Security settings, functions, and tasks from a configuration file.
<a href="#"><u><code>KAVSHELL EXPORT</code></u></a>	Export all Kaspersky Embedded Systems Security settings and existing tasks to a configuration file.
<a href="#"><u><code>KAVSHELL DEVCONTROL</code></u></a>	Add to the list of generated device control rules according to selected method.

## Displaying Kaspersky Embedded Systems Security command help: KAVSHELL HELP

To view the list of all Kaspersky Embedded Systems Security commands, run one of the following commands:

```
KAVSHELL
```

```
KAVSHELL HELP
```

```
KAVSHELL /?
```

To view a description of a command and its syntax, run one of the following commands:

```
KAVSHELL HELP <command>
```

```
KAVSHELL <command> /?
```

## KAVSHELL HELP examples

To view detailed information about the KAVSHELL SCAN command, execute the following command:

```
KAVSHELL HELP SCAN
```

## Starting and stopping the Kaspersky Security Service KAVSHELL START: KAVSHELL STOP

To run the Kaspersky Security Service, execute the following command:

```
KAVSHELL START
```

By default, when the Kaspersky Security Service is started, Real-Time File Protection and Scan at Operating System Startup, as well as other tasks scheduled to start **At application launch**, will be started.

To stop the Kaspersky Security Service, execute the following command:

```
KAVSHELL STOP
```

A password might be required to execute the command. To enter the current password, use `[/pwd : <password>]`.

## Scanning a selected area: KAVSHELL SCAN

To start a task to scan specific areas of the protected device, use `KAVSHELL SCAN`. The command-line options specify the scan scope and security settings of the selected node.

An On-Demand Scan task started using the `KAVSHELL SCAN` command is a temporary task. It is displayed in the Application Console only while being executed (you cannot view its task settings in the Application Console). However, a task performance log is generated and displayed under the **Task logs** node in the Application Console.

When specifying paths in scan tasks for specific areas, you can use environment variables. If you use a user environment variable, execute the `KAVSHELL SCAN` command as the corresponding user.

The `KAVSHELL SCAN` command is executed in synchronous mode.

To start an existing On-Demand Scan task from the command line, use the [KAVSHELL TASK](#) command.

## KAVSHELL SCAN command syntax

```
KAVSHELL SCAN <scan scope> [/MEMORY|/SHARED|/STARTUP|/REMDRIVES|/FIXDRIVES|/MYCOMP] [/L:<
path to file with the list of scan scopes >] [/F<A|C|E>] [/NEWONLY] [/AI:
<DISINFECT|DISINFDEL|DELETE|REPORT|AUTO>] [/AS:<QUARANTINE|DELETE|REPORT|AUTO>]
[/DISINFECT|/DELETE] [/E:<ABMSPO>] [/EM:<"masks">] [/ES:<size>] [/ET:<number of seconds>]
[/TZOFF] [/OF:<SKIP|RESIDENT|SCAN[=<days>] [NORECALL]>] [/NOICHECKER][/NOISWIFT]
[/ANALYZERLEVEL][/NOCHECKMSSIGN][W:<path to task log file>] [/ANSI] [/ALIAS:<task
alias>]
```

The KAVSHELL SCAN command has both mandatory and optional parameters/options (see the table below).

## KAVSHELL SCAN command examples

```
KAVSHELL SCAN Folder56 D:\Folder1\Folder2\Folder3\ C:\Folder1\ C:\Folder2\3.exe
"\another server\Shared\" F:\123\*.fgb /SHARED /AI:DISINFDEL /AS:QUARANTINE /FA /E:ABM
/EM:"*.xtx;*.fff;*.ggg;*.bbb;*.info" /NOICHECKER /ANALYZERLEVEL:1 /NOISWIFT /W:log.log
```

```
KAVSHELL SCAN /L:scan_objects.lst /W:c:\log.log
```

KAVSHELL SCAN command-line parameters/options

Parameter/option	Description
<b>Scan scope.</b> Mandatory parameter.	
<files>	Specifies the scan scope - list of files, folders, network paths and predefined areas. Specify network paths in Universal Naming Convention (UNC) format.
<folders>	In the following example, the Folder4 folder is specified without a path, which implies that it is located in the folder from which the KAVSHELL command is run: KAVSHELL SCAN Folder4 If the name of the object to be scanned has spaces, it must be wrapped in quotation marks.
<network path>	If a folder is specified, Kaspersky Embedded Systems Security will also scan all its subfolders. The symbols * or ? can be used to scan a group of files.
/MEMORY	Scan objects in RAM
/SHARED	Scan shared folders on the protected device
/STARTUP	Scan autorun objects
/REMDRIVES	Scan removable drives
/FIXDRIVES	Scan hard drives
/MYCOMP	Scan all areas of the protected device
/L:<path to file with a list of scan scopes>	Full path to file with a list of scan scopes. Use line breaks to separate the scan scopes in the file. You can specify predefined scan areas as shown in the following example of the content of a file with a list of scan scopes: C:\ D:\Docs\*.doc E:\My Documents /STARTUP /SHARED

<b>Scan objects</b> (File types). If you do not specify this option, Kaspersky Embedded Systems Security will scan objects by their format.	
/FA	Scan all objects
/FC	Scan objects by format (default). Kaspersky Embedded Systems Security scans only objects whose formats are included in the list of formats of infectable objects.
/FE	Scan objects by extension. Kaspersky Embedded Systems Security scans only objects with extensions included into the list of extensions of infectable objects.
/NEWONLY	Scan only new and modified files.  If you do not specify this option, Kaspersky Embedded Systems Security will scan all objects.
<b>Action to perform on infected and other objects.</b> If you do not specify values for this modifier, Kaspersky Embedded Systems Security will perform the <b>Skip</b> action.	
DISINFECT	Disinfect, skip if disinfection is not possible  The DISINFECT and DELETE options are preserved in the current version Kaspersky Embedded Systems Security in order to ensure compatibility with previous versions. These options can be used instead of the /AI and /AS options. In this case, Kaspersky Embedded Systems Security will not process probably infected objects.
DISINFDEL	Disinfect, delete if disinfection is not possible
DELETE	Delete  The DISINFECT and DELETE options are saved in the current version of Kaspersky Embedded Systems Security in order to ensure compatibility with previous versions. These options can be used instead of the /AI and /AS options. In this case, Kaspersky Embedded Systems Security will not process probably infected objects.
REPORT	Send report (default)
AUTO	Perform recommended action
<b>/AS: Action to perform on probably infected objects.</b> If you do not specify this option, Kaspersky Embedded Systems Security will perform the <b>Skip</b> action.	
QUARANTINE	Quarantine
DELETE	Delete
REPORT	Send report (default)
AUTO	Perform recommended action
<b>Exclusions</b>	
/E:ABMSPO	Exclude the following types of compound objects: A – archives (scan SFX archives only) B – email databases M – plain mail S – archives and SFX-archives P – packed objects O – embedded OLE objects
/EM:<"masks" >	Exclude files by mask  You can specify several masks, for example: EM:"*.txt; *.png; C\Videos\*.avi".
/ET:<number of	Stop processing an object if it takes longer than the number of seconds specified by

seconds>	<number of seconds>. By default, there is no time restriction.
/ES:<size>	Do not scan compound objects larger than the size (in MB) specified by the value <size>. By default, Kaspersky Embedded Systems Security scans objects of all sizes.
/TZOFF	Disable Trusted Zone exclusions
<b>Advanced settings (Options)</b>	
/NOICHECKER	Disable the use of iChecker (enabled by default)
/NOISWIFT	Disable the use of iSwift (enabled by default)
/ANALYZERLEVEL: <heuristic analysis level>	Enable Heuristic Analyzer, configure analysis level. The following heuristic analysis levels are available: 1 – light 2 – medium 3 – deep If you omit this option, Kaspersky Embedded Systems Security will not use Heuristic Analyzer.
/ALIAS:<task alias>	Assigns a temporary name to an On-Demand Scan task, allowing you to reference it while it runs, for example, in order to view its statistics using the TASK command. The task alias must be unique among the task aliases of all Kaspersky Embedded Systems Security components.  If this option is not specified, a temporary name in the form of scan_<kavshell_pid> is assigned, for example, scan_1234. In the Application Console, the task is assigned the name "Scan objects <date and time>", for example, Scan objects 8/16/2007 5:13:14 PM.
<b>Task log settings (Report settings)</b>	
/W:<path to task log file>	If this parameter is specified, Kaspersky Embedded Systems Security will save the task log file using the name specified by the parameter value.  The log file contains task execution statistics, the time when the task was started and completed (stopped), and information about events that occurred during the task.  The log is used to register events defined by the task log settings and the Kaspersky Embedded Systems Security event log settings in Event Viewer.  You can specify either the absolute or relative path to the log file. If you specify only a filename without a path, the log file will be created in the current folder.  Restarting the command with the same log settings will overwrite the existing log file.  The log file can be viewed while a task is running.  The log appears in the Task logs node of the Application Console.  If Kaspersky Embedded Systems Security fails to create the log file, it will display an error message but will still execute the command.
/ANSI	This option uses ANSI encoding to record events to the task log.  The ANSI option will not be applied if the W parameter is not specified.  If the ANSI option is not specified, UNICODE is used to generate the task log.

## Starting the Critical Areas Scan task: KAVSHELL SCANCRITICAL

Use the `KAVSHELL SCANCRITICAL` command to start the Critical Areas Scan task with the settings defined in the Application Console.

## KAVSHELL SCANCRITICAL command syntax

```
KAVSHELL SCANCRITICAL [/W:<path to task log file>]
```

## KAVSHELL SCANCRITICAL command examples

To run the Critical Areas Scan task and save a task log named `scancritical.log` in the current folder, execute the following command:

```
KAVSHELL SCANCRITICAL /W:scancritical.log
```

You can use the `/W` parameter to configure the location of the task log (see the table below).

Syntax of the `/W` parameter for the `KAVSHELL SCANCRITICAL` command

Parameter/option	Description
<code>/W:&lt;path to task log file&gt;</code>	<p>If this parameter is specified, Kaspersky Embedded Systems Security will save the task log file using the name specified by the parameter value.</p> <p>The log file contains task execution statistics, the time when the task was started and completed (stopped), and information about events that occurred during the task.</p> <p>The log is used to register events defined by the task log settings and the Kaspersky Embedded Systems Security event log settings in Event Viewer.</p> <p>You can specify either the absolute or relative path to the log file. If you specify only a filename without a path, the log file will be created in the current folder.</p> <p>Restarting the command with the same log settings will overwrite the existing log file.</p> <p>The log file can be viewed while a task is running.</p> <p>The log appears in the <b>Task logs</b> node of the Application Console.</p> <p>If Kaspersky Embedded Systems Security fails to create the log file, it will display an error message but will still execute the command.</p>

## Managing tasks asynchronously: KAVSHELL TASK

You can use the `KAVSHELL TASK` command to manage the specified task: run, pause, resume and stop the task and view the current task status and statistics. The command is performed in asynchronous mode.

A password might be required to execute the command. To enter the current password, use `[/pwd:<password>]`.

## KAVSHELL TASK command syntax

```
KAVSHELL TASK [<task name alias> </START | /STOP | /PAUSE | /RESUME | /STATE | /STATISTICS >]
```

## KAVSHELL TASK command examples

KAVSHELL TASK

KAVSHELL TASK on-access /START

KAVSHELL TASK user-task\_1 /STOP

KAVSHELL TASK scan-computer /STATE

KAVSHELL TASK network-attack-blocker /START

The KAVSHELL TASK command can run without parameters/options or with one or more parameters/options (see the table below).

KAVSHELL TASK command-line parameters/options

Parameter/option	Description
No parameters	Return the list of all existing Kaspersky Embedded Systems Security tasks. The list includes the following fields: task alias, task category (system or custom) and current task status.
<task alias>	Instead of the task name, in the SCAN TASK command, use its task alias, an additional abbreviated name that Kaspersky Embedded Systems Security assigns to tasks. To view Kaspersky Embedded Systems Security task aliases, enter the KAVSHELL TASK command without any parameters.
/START	Start the specified task in asynchronous mode.
/STOP	Stop the specified task.
/PAUSE	Pause the specified task.
/RESUME	Resume the specified task in asynchronous mode.
/STATE	Return the current task status (for example, <i>Running</i> , <i>Completed</i> , <i>Paused</i> , <i>Stopped</i> , <i>Failed</i> , <i>Starting</i> , <i>Resuming</i> ).
/STATISTICS	Retrieve task statistics - Information about the number of objects processed from the time the task started

Note that not all Kaspersky Embedded Systems Security tasks fully support /PAUSE, /RESUME and /STATE keys.

[Return codes for the KAVSHELL TASK command.](#)

## Removing the PPL attribute: KAVSHELL CONFIG

The KAVSHELL CONFIG command lets you remove the PPL (Protected Process Light) attribute for the Kaspersky Security Service using the ELAM driver installed during installation of the application.

KAVSHELL CONFIG command syntax

KAVSHELL CONFIG /PPL:<OFF>

Parameter/option	Description
/PPL:OFF	Remove the PPL attribute for the Kaspersky Security Service.

## Starting and stopping Real-Time Computer Protection tasks: KAVSHELL RTP

You can use the KAVSHELL RTP command to start or stop all the Real-Time Computer Protection tasks.

A password might be required to execute the command. To enter the current password, use [/pwd: <password>].

### KAVSHELL RTP command syntax

```
KAVSHELL RTP {/START | /STOP}
```

### KAVSHELL RTP command examples

To start all the Real-Time Computer Protection tasks, execute the following command:

```
KAVSHELL RTP /START
```

The KAVSHELL RTP command must include one of two options (see the table below).

#### KAVSHELL RTP command-line options

Parameter/options	Description
/START	Start all the Real-Time Computer Protection tasks: Real-Time File Protection and KSN Usage.
/STOP	Stop all the Real-Time Computer Protection tasks.

## Managing the Applications Launch Control task: KAVSHELL APPCONTROL /CONFIG

You can use the KAVSHELL APPCONTROL /CONFIG command to configure the mode in which the Applications Launch Control task runs and monitors the loading of DLL modules.

### KAVSHELL APPCONTROL /CONFIG command syntax

```
/config /mode:<applyrules|statistics> [/dll:<no|yes>] | /config /savetofile:<full path to XML file>
```

### KAVSHELL APPCONTROL /CONFIG command examples

To run the Applications Launch Control task in **Active** mode without monitoring DLL loading save the task settings upon completion, run the following command:

```
KAVSHELL APPCONTROL /CONFIG /mode:applyrules /dll:<no>
/savetofile:c:\appcontrol\config.xml
```

You can configure Applications Launch Control task settings using the command-line parameters (see the table below).

KAVSHELL APPCONTROL /CONFIG command-line parameters/options

Parameter/option	Description
/mode:<applyrules statistics>	Operating mode of the Applications Launch Control task.  You can select one of the following modes: <ul style="list-style-type: none"> <li>• active - Apply Applications Launch Control rules;</li> <li>• statistics - Only generate statistics.</li> </ul>
/dll:<no yes>	Enable or disable monitoring of DLL loading.
/savetofile: <path to XML file>	Export the specified rules to the indicated file in XML format.
/savetofile: <the fullname to xml file>	Save the list of rules to file.
/savetofile: <the fullname to xml file> /sdc	Save the list of Software Distribution Control rules to file.
/clearsdc	Delete all Software Distribution Control rules from the list.

## Rule Generator for Applications Launch Control: KAVSHELL APPCONTROL /GENERATE

You can use the KAVSHELL APPCONTROL /GENERATE command to generate Applications Launch Control rule lists.

A password might be required to execute the command. To enter the current password, use [/pwd: <password>].

### KAVSHELL APPCONTROL /GENERATE command syntax

```
KAVSHELL APPCONTROL /GENERATE <path to folder> | /source:<path to file with folders list>
[/masks:<edms>] [/runapp] [/rules:<ch|cp|h>] [/strong] [/user:<user or group of users>]
[/export:<path to XML file>] [/import:<a|r|m>] [/prefix:<prefix for rules names>]
[/unique]
```

### KAVSHELL APPCONTROL /GENERATE command examples

To generate rules for files from specified folders, execute the following command:

```
KAVSHELL APPCONTROL /GENERATE /source:c\folderslist.txt
/export:c:\rules\appctrlrules.xml
```

To generate rules for executable files with any extension in the specified folder and, upon the task completion, save the generated rules in the specified file XML file, execute the following command:

```
KAVSHELL APPCONTROL /GENERATE c:\folder /masks:edms /export:c:\rules\appctrlrules.xml
```

You can use command-line parameters/options to configure automatic rule generation settings for the Applications Launch Control task (see the table below).

KAVSHELL APPCONTROL /GENERATE command-line parameters/options

Parameter/option	Description
<b>Allowing rules scope</b>	
<path to folder>	Specify the path to the folder with executable files for which allowing rules will be automatically generated.
/source: <path to file with folders list>	Specify the path to a TXT file with a list of folders with executable files for which allowing rules will be automatically generated.
/masks: <edms>	Specify the extensions of executable files for which allowing rules will be automatically generated. You can include files with the following extensions in the rules scope: <ul style="list-style-type: none"> <li>• e - EXE files</li> <li>• d - DLL files</li> <li>• m - MSI files</li> <li>• s - scripts</li> </ul>
/runapp	When generating allowing rules, account for applications currently running on the protected device.
<b>Actions when automatically generating allowing rules</b>	
/rules: <ch cp h>	Specify actions to perform while generating allowing rules for the Applications Launch Control task: <ul style="list-style-type: none"> <li>• ch – Use the digital certificate. If the certificate is missing, use the SHA256 hash.</li> <li>• cp – Use the digital certificate. If the certificate is missing, use the path to the executable file.</li> <li>• h - Use the SHA256 hash.</li> </ul>
/strong	Use the digital certificate's subject and thumbprint while automatically generating allowing rules for the Applications Launch Control task. The command is executed if the /rules: <ch cp> parameter is specified.
/user: <user or group of users>	Specify the user or group of users for which the rules will be applied. The application will monitor any applications run by the specified user and / or group of users.

Actions on completion of the Rule Generator for Applications Launch Control task	
<code>/export: &lt;path to XML file&gt;</code>	Save the generated rules to an XML file.
<code>/unique</code>	Add information about the protected device with installed applications that are the basis for generating the Applications Launch Control allowing rules.
<code>/prefix: &lt;prefix for rule names&gt;</code>	Specify a prefix for the names of Applications Launch Control allowing rules.
<code>/import: &lt;a r m&gt;</code>	<p>Import the generated rules into the specified list of Applications Launch Control rules according to the selected import rule:</p> <ul style="list-style-type: none"> <li>• <b>a - Add to existing rules</b> (rules with identical settings are duplicated)</li> <li>• <b>r - Replace existing rules</b> (rules with identical settings are not added; a rule is added if at least one rule setting is unique)</li> <li>• <b>m - Merge with existing rules</b> (rules with identical settings are not added; a rule is added if at least one rule setting is unique)</li> </ul>

## Filling the list of Applications Launch Control rules: KAVSHELL APPCONTROL

You can use the `KAVSHELL APPCONTROL` command to add rules from an XML file to the Applications Launch Control task's rule list according to the selected import rule and to delete all existing rules from the list.

A password might be required to execute the command. To enter the current password, use `[/pwd: <password>]`.

### KAVSHELL APPCONTROL command syntax

```
KAVSHELL APPCONTROL /append <path to XML file> | /replace <path to XML file> | /merge <path to XML file> | /clear
```

### KAVSHELL APPCONTROL command examples

To add rules from an XML file to existing Applications Launch Control rules according to the *Add to existing rules* import rule, execute the following command:

```
KAVSHELL APPCONTROL /append c:\rules\appctr1rules.xml
```

You can use command-line parameters to select principle to add new rules from the specified XML file to the defined list of Applications Launch Control rules (see the table below).

KAVSHELL APPCONTROL command-line parameters/options

Parameter/option	Description
<code>/append &lt;path to XML file&gt;</code>	Update the list of Applications Launch Control rules based on the specified XML file. Import rule - <b>Add to existing rules</b> (rules with identical settings are duplicated).

/replace <path to XML file>	Update the list of Applications Launch Control rules based on the specified XML file. Import rule - <b>Replace existing rules</b> (rules with identical settings are not added; a rule is added if at least one rule setting is unique).
/merge <path to XML file>	Update the list of Applications Launches Control rules based on the specified XML file. Import rule - <b>Merge with existing rules</b> (new rules do not duplicate existing rules).
/clear	Clear the list of Applications Launch Control rules.

## Filling the list of Device Control rules: KAVSHELL DEVCONTROL

You can use the `KAVSHELL DEVCONTROL` command to add rules from an XML file to the Device Control task's rule list according to the selected import rule and to delete all existing rules from the list.

A password might be required to execute the command. To enter the current password, use `[/pwd: <password>]`.

### KAVSHELL DEVCONTROL command syntax

```
KAVSHELL DEVCONTROL /append <path to XML file> | /replace <path to XML file> | /merge <path to XML file> | /clear
```

### KAVSHELL DEVCONTROL command examples

*To add rules from an XML file to the Device Control task's existing rules according to Add to existing rules import rule, execute the following command:*

```
KAVSHELL DEVCONTROL /append :c:\rules\devctr1rules.xml
```

You can use command-line parameters to select the import rule used to add new rules from the specified XML file to the defined list of Device Control rules (see the table below).

KAVSHELL DEVCONTROL command-line parameters/options

Key	Description
/append <path to XML file>	Update the list of Device Control rules based on the specified XML file. Import rule - <b>Add to existing rules</b> (rules with identical settings are duplicated).
/replace <path to XML file>	Update the list of Device Control rules based on the specified XML file. Import rule - <b>Replace existing rules</b> (rules with identical parameters are not added; the rule is added if at least one rule setting is unique).
/merge <path to XML file>	Update the list of Device Control rules based on the specified XML file. Import rule - <b>Merge with existing rules</b> (new rules do not duplicate existing rules).
/clear	Clear the list of Device Control rules.

## Starting the Database Update task: KAVSHELL UPDATE

The KAVSHELL UPDATE command can be used to start the Kaspersky Embedded Systems Security Database Update task in synchronous mode.

A Database Update task started using the KAVSHELL UPDATE command is a temporary task. It is only displayed in the Application Console while being executed. However, a task log is generated and displayed in the **Task logs** in the Application Console. Kaspersky Security Center policies may apply to update tasks created and started using the KAVSHELL UPDATE command and update tasks created in the Application Console. For information about using Kaspersky Security Center to manage Kaspersky Embedded Systems Security on protected devices, see Section "Managing Kaspersky Embedded Systems Security using Kaspersky Security Center".

Environment variables can be used when specifying the path to an update source in this task. If a user environment variable is used, run the KAVSHELL UPDATE command as the corresponding user.

### KAVSHELL UPDATE command syntax

```
KAVSHELL UPDATE < Path to update source | /AK | /KL> [/NOUSEKL] [/PROXY:<address>:<port>]
[/AUTHTYPE:<0-2>] [/PROXYUSER:<user name>] [/PROXYPWD:<password>] [/NOPROXYFORKL]
[/USEPROXYFORCUSTOM] [/NOFTPPASSIVE] [/REG:<iso3166 code>] [/W:<path to task log file>]
[/ALIAS:<task alias>]
```

The KAVSHELL UPDATE command has both mandatory and optional parameters/options (see the following table).

### KAVSHELL UPDATE command examples

*To start a custom Database Update task, execute the following command:*

```
KAVSHELL UPDATE
```

*To run the Database Update task using update files in the \\server\databases network folder, run the following command:*

```
KAVSHELL UPDATE \\server\databases
```

*To start a Database Update from the FTP server ftp://dn1-ru1.kaspersky-labs.com/ and write all task events to a file named c:\update\_report.log, execute the following command:*

```
KAVSHELL UPDATE ftp://dn1-ru1.kaspersky-labs.com /W:c:\update_report.log
```

*To download Kaspersky Embedded Systems Security database updates from Kaspersky's update server, connect to the updates source through a proxy server (proxy server address: proxy.company.com, port: 8080). To access the protected device using the in-built Microsoft Windows NTLM authentication with user name "inetuser" and password "123456" execute the following command:*

```
KAVSHELL UPDATE /KL /PROXY:proxy.company.com:8080 /AUTHTYPE:1 /PROXYUSER:inetuser
/PROXYPWD:123456
```

KAVSHELL UPDATE command-line parameters/options

Parameter/option	Description

**Update source** (mandatory parameter). Specify one or more sources. Kaspersky Embedded Systems Security will access the sources in the order in which they are listed. Separate sources with a space.

<path in UNC format>	User-defined update source. Path to network update folder in the UNC format.
<URL>	User-defined update source. HTTP or FTP server address where the update folder is located.
<Local folder>	User-defined update source. Folder on the protected device.
/AK	Use the Kaspersky Security Center Administration server as the updates source.
/KL	Use the Kaspersky's update Servers as the update source.
/NOUSEKL	Do not use Kaspersky's update servers if other update sources are not available (used by default).
<b>Proxy server settings</b>	
/PROXY:<address>:<port>	Network name or IP address of the proxy server and its port. If this parameter is not specified, Kaspersky Embedded Systems Security will automatically detect the proxy server settings used in the local area network.
/AUTHTYPE:<0-2>	<p>This parameter specifies the authentication method used to access the proxy server. It can have the following values:</p> <p><b>0</b> – Microsoft Windows NTLM authentication; Kaspersky Embedded Systems Security will contact the proxy server using the <b>Local system (SYSTEM)</b> account</p> <p><b>1</b> – Microsoft Windows NTLM authentication; Kaspersky Embedded Systems Security will contact the proxy server using the user name and password specified by the /PROXYUSER and /PROXYPWD parameters</p> <p><b>2</b> – Authentication using the user name and password specified by the /PROXYUSER and /PROXYPWD parameters (basic authentication)</p> <p>If the proxy server does not require authentication, there is no need to specify this parameter.</p>
/PROXYUSER:<user name>	User name that will be used to access the proxy server. If /AUTHTYPE:0 is specified, then the /PROXYUSER:<user name> and /PROXYPWD:<password> parameters will be ignored.
/PROXYPWD:<password>	User password that will be used to access the proxy server. If /AUTHTYPE:0 is specified, then the /PROXYUSER:<user name> and /PROXYPWD:<password> parameters will be ignored. If the /PROXYUSER parameter is specified and the /PROXYPWD parameter is omitted, the password will be considered an empty string.
/NOPROXYFORKL	Do not use proxy server settings to connect to Kaspersky's update servers (used by default).
/USEPROXYFORCUSTOM	Use proxy server settings to connect to user-defined update sources (not used by default).
/USEPROXYFORLOCAL	Use proxy server settings to connect to local update sources. If not specified, the <b>Do not use proxy server for local addresses</b> setting will apply.
<b>General FTP and HTTP server settings</b>	
/NOFTPPASSIVE	If this key is specified, Kaspersky Embedded Systems Security will use active FTP server mode to connect to the protected device. If this key is not specified, Kaspersky Embedded Systems Security will use the passive FTP server mode, if possible.
/TIMEOUT:<number of	FTP or HTTP server connection timeout. If you do not specify this parameter,

seconds>	Kaspersky Embedded Systems Security will use the default value of 10 seconds. The value must be a whole number.
/REG:<iso3166 code>	<p>Regional settings. This parameter is used when receiving updates from Kaspersky's update servers. Kaspersky Embedded Systems Security minimizes the load on the protected device by selecting the closest update server.</p> <p>The value of this parameter should be the ISO 3166-1 alpha-2 code of the country where the protected device is located, for example /REG: gr or /REG:US. If this key is omitted or an invalid country code is specified, Kaspersky Embedded Systems Security will detect the location of the protected device based on the regional settings of the protected device where the Application Console is installed.</p>
/ALIAS:<task alias>	<p>This parameter lets you assign a temporary name to the task, allowing you to reference the task while it runs. For example, task statistics can be viewed using the TASK command. The task alias must be unique among the task aliases of all Kaspersky Embedded Systems Security components.</p> <p>If this key is not specified, a temporary name in the form update_&lt;kavshell_pid&gt; is used; for example, update_1234. In the Application Console, the task is assigned the name "Update-databases &lt;date time&gt;"; for example, Update-databases 8/16/2007 5:41:02 PM.</p>
/W:<path to task log file>	<p>If this parameter is specified, Kaspersky Embedded Systems Security will save the task log file using the name specified by the parameter value.</p> <p>The log file contains task execution statistics, the time when the task was started and completed (stopped), and information about events that occurred during the task.</p> <p>The log is used to register events defined by the task log settings and the Kaspersky Embedded Systems Security event log settings in Event Viewer.</p> <p>You can specify either the absolute or relative path to the log file. If you specify only a filename without a path, the log file will be created in the current folder.</p> <p>Restarting the command with the same log settings will overwrite the existing log file.</p> <p>The log file can be viewed while a task is running.</p> <p>The log appears in the <b>Task logs</b> node of the Application Console.</p> <p>If Kaspersky Embedded Systems Security fails to create the log file, it will display an error message but will still execute the command.</p>

[Return codes for the KAVSHELL UPDATE command.](#)

## Rolling back Kaspersky Embedded Systems Security database updates: KAVSHELL ROLLBACK

The KAVSHELL ROLLBACK command can be used to perform a Rollback of Database Update local system task (rolls back Kaspersky Embedded Systems Security databases to the previously installed version). The command is performed synchronously.

Command syntax:

KAVSHELL ROLLBACK

[Return codes for the KAVSHELL ROLLBACK command.](#)

## Managing log inspection: KAVSHELL TASK LOG-INSPECTOR

The KAVSHELL TASK LOG-INSPECTOR command can be used to monitor the integrity of the environment based on an analysis of the Windows Event Log.

### Command syntax

```
KAVSHELL TASK LOG-INSPECTOR
```

### Command examples

```
KAVSHELL TASK LOG-INSPECTOR /stop
```

KAVSHELL TASK LOG-INSPECTOR command-line options

Option	Description
/START	Start the specified task in asynchronous mode.
/STOP	Stop the specified task.
/STATE	Return the current task status (for example, <i>Running</i> , <i>Completed</i> , <i>Paused</i> , <i>Stopped</i> , <i>Failed</i> , <i>Starting</i> , <i>Resuming</i> )
/STATISTICS	Retrieve task statistics - Information about the number of objects processed from the time the task started.

[Return codes for the KAVSHELL TASK LOG-INSPECTOR command.](#)

## Activating the application: KAVSHELL LICENSE

Kaspersky Embedded Systems Security keys and activation codes can be managed using the KAVSHELL LICENSE command.

A password might be required to execute the command. To enter the current password, use [/pwd: <password>].

### KAVSHELL LICENSE command syntax

```
KAVSHELL LICENSE [/ADD:<key file | activation code> [/R] | /DEL:<key | activation code number>]
```

### KAVSHELL LICENSE command examples

*To activate the application, execute the command:*

```
KAVSHELL.EXE LICENSE / ADD: <activation code or key>
```

To view information on added keys, execute the command:

```
KAVSHELL LICENSE
```

To remove an added key with number 0000-000000-00000001, execute the command:

```
KAVSHELL LICENSE /DEL:0000-000000-00000001
```

The KAVSHELL LICENSE command can run with or without keys (see the table below).

KAVSHELL LICENSE command-line parameters/options

Parameter	Description
Without keys	The command returns the following information about added keys: <ul style="list-style-type: none"><li>• Key.</li><li>• License type (commercial).</li><li>• Duration of the license associated with the key.</li><li>• Key status (active or additional). If the status is *, the key was added as an additional key.</li></ul>
/ADD:<key file name or activation code>	Add a key via the specified file or an activation code. System environment variables can be used when specifying the path to a key file; user environment variables are not allowed.
/R	The /R activation code or key is in addition to the /ADD activation code or key and indicates that the activation code or key being added is an additional activation code or key.
/DEL:<key or activation code>	Deletes the key with the specified number or activation code.

[Return codes for the KAVSHELL LICENSE command.](#)

## Enabling, configuring and disabling trace logs: KAVSHELL TRACE

The KAVSHELL TRACE command can be used to enable and disable the trace log for all Kaspersky Embedded Systems Security subsystems and to set the log detail level.

Kaspersky Embedded Systems Security writes information to trace files and the dump file in unencrypted form.

### KAVSHELL TRACE command syntax

```
KAVSHELL TRACE </ON /F:<path to trace log file folder> [/S:<maximum log size in megabytes>] [/LVL:debug|info|warning|error|critical] [/r:<maximum number of trace files for rotation>] | /OFF>
```

If the trace log is enabled and you wish to change its settings, enter the KAVSHELL TRACE command with the /ON option and use the /S and /LVL parameters to specify the trace log settings (see the table below).

Key	Description
/ON	Enables the trace log.
/F:<folder with trace log files>	<p>This parameter specifies the full path to the folder where trace log files will be saved (required).</p> <p>If a path to a non-existent folder is specified, no trace log will be created. Paths to folders on the network drives of other protected devices cannot be specified.</p> <p>If the path specified by the parameter has a space, it needs to be enclosed in quotes, for example, /F:"C:\Trace Folder".</p> <p>System environment variables can be used when specifying the path to the trace log files; user environment variables are not allowed.</p>
/S: <maximum log file size in megabytes>	<p>This key sets the maximum size of a single trace log file. As soon as the log file reaches the maximum size, Kaspersky Embedded Systems Security will start recording information in a new file; the previous log file will be saved.</p> <p>If the value of this parameter is not specified, the maximum size of one log file will be 50 MB.</p>
/LVL:debug info warning error critical	<p>This parameter sets the log detail level from maximum (<b>All debug information</b>), in which all events are recorded in the log, to minimum (<b>Critical events</b>), in which only critical events are recorded.</p> <p>If this parameter is not specified, all events included in the <b>All debug information</b> level of detail will be recorded in the trace log.</p>
/r:<maximum number of trace files for rotation>	<p>This parameter enables the trace files rotation. If the trace files rotation is enabled and the &lt;maximum number of trace files for rotation&gt; is reached, before a new file is created, the oldest file is removed.</p> <p>Available values: from 1 to 999. If the value is not specified, the trace files rotation is not enabled and the application returns an error.</p>
/OFF	This option disables the trace log.

## KAVSHELL TRACE command examples

To enable the trace log using the **All debug information** level of detail and a maximum log size of 200MB, saving the log file to the "C:\Trace Folder" folder, execute the command:

```
KAVSHELL TRACE /ON /F:"C:\Trace Folder" /S:200
```

To enable the trace log using the **Important events** level of detail, saving the log file to the "C:\Trace Folder" folder, execute the command:

```
KAVSHELL TRACE /ON /F:"C:\Trace Folder" /LVL:warning
```

To enable the trace log using the **Important events** level of detail, saving the log file to the "C:\Trace Folder" folder, and to enable the trace files rotation after a maximum number of 50 trace files is reached, execute the command:

```
KAVSHELL TRACE /ON /F:"C:\Trace Folder" /LVL:warning /r:50
```

To disable the trace log, execute the command:

```
KAVSHELL TRACE /OFF
```

[Return codes for the KAVSHELL TRACE command.](#)

## Defragmenting Kaspersky Embedded Systems Security log files: KAVSHELL VACUUM

You can use the KAVSHELL VACUUM command to defragment the application's log files. This helps avoid system and application errors due to storing a large number of log files containing application events.

A password might be required to execute the command. To enter the current password, use [ /pwd : <password> ].

We recommend that you apply the KAVSHELL VACUUM command to optimize log file storage in case On-Demand Scan and update tasks are run frequently. This command causes Kaspersky Embedded Systems Security update the logical structure of the application's log files stored on a protected device at the specified path.

By default, the application's log files are stored at "C:\ProgramData\Kaspersky Lab\Kaspersky Embedded Systems Security\3.2\Reports". If you have manually specified another path for storing logs, the KAVSHELL VACUUM command defragments the files in the folder specified in the Kaspersky Embedded Systems Security log settings.

Large file sizes increase the time required for the KAVSHELL VACUUM command to complete the defragment operation.

The Real-Time Protection and Computer Control tasks are not available while the KAVSHELL VACUUM command is executed. The defragmentation process restricts access to the Kaspersky Embedded Systems Security log and prevents event logging. To avoid a reduction in protection, we recommend that you plan when you will run the KAVSHELL VACUUM command.

To defragment the Kaspersky Embedded Systems Security log files, execute the following command:

```
KAVSHELL VACUUM
```

This command requires Local System account rights.

## Cleaning iSwift base: KAVSHELL FBRESET

Kaspersky Embedded Systems Security uses iSwift technology, which lets the application avoid rescanning files that have not been modified since the last scan (**Use iSwift technology**).

Kaspersky Embedded Systems Security creates klamfb.dat and klamfb2.dat files in the "%SYSTEMDRIVE%\System Volume Information" folder. These files contain information about clean objects that have already been scanned. The klamfb.dat (klamfb2.dat) file grows with the number of files scanned by Kaspersky Embedded Systems Security. It only contains current information about files in the system: if a file is removed, Kaspersky Embedded Systems Security purges the corresponding information from klamfb.dat.

To clear a file, use the `KAVSHELL FBRESET` command.

Please keep in mind the following specifics when using the `KAVSHELL FBRESET` command:

- When using the `KAVSHELL FBRESET` command to clear the klamfb.dat file, Kaspersky Embedded Systems Security does not pause the protection (unlike what happens if klamfb.dat is deleted manually).
- Kaspersky Embedded Systems Security may increase the protected device workload after the data in klamfb.dat is cleared. In this case, Kaspersky Embedded Systems Security scans all files accessed for the first time after klamfb.dat is cleared. After the scan, Kaspersky Embedded Systems Security puts information about each scanned object back into klamfb.dat. If there are new attempts to access an object, iSwift technology prevents rescanning of the file if it has not been changed.

The `KAVSHELL FBRESET` command is available only if the command-line interpreter is started under the SYSTEM account.

## Enabling and disabling dump file creation: `KAVSHELL DUMP`

You can use the `KAVSHELL DUMP` command to enable or disable creation of snapshots (dump files) of Kaspersky Embedded Systems Security processes if they terminate abnormally (see the following table). Additionally, you can create a dump file of running Kaspersky Embedded Systems Security processes at any time.

To create a dump file successfully, the `KAVSHELL DUMP` command must be executed under the local system account (SYSTEM).

Kaspersky Embedded Systems Security writes information to trace files and the dump file in unencrypted form.

The `KAVSHELL DUMP` command can not be used for x64 processes.

### `KAVSHELL DUMP` command syntax

```
KAVSHELL DUMP </ON /F:<folder with the dump file>|/SNAPSHOT /F:< folder with the dump file> / P:<pid> | /OFF>
```

`KAVSHELL DUMP` command-line parameters/options

Key	Description

/ON	Enables creation of a dump file if a process terminates abnormally.
/F:<path to folder with dump files>	This is a mandatory parameter. It specifies the path to the folder where the dump file will be saved. Paths to folders on the network drives of other unprotected devices are not allowed.  System environment variables can be used when specifying the path to the folder for the dump file; user environment variables are not allowed.
/SNAPSHOT	Takes a snapshot of the memory of the running process with the specified PID and saves the dump file in the folder specified by the /F parameter.
/P	The process identifier (PID) is displayed in the Microsoft Windows Task Manager.
/OFF	Disables the creation of a dump file if a process terminates abnormally.

### [Return codes for the KAVSHELL DUMP command.](#)

## KAVSHELL DUMP command examples

*To enable creation of a dump file; saving the dump file to the "C:\Dump Folder" folder, execute the command:*

```
KAVSHELL DUMP /ON /F:"C:\Dump Folder"
```

*To make a dump for the process with ID 1234 in the "C:/Dumps" folder, execute the command:*

```
KAVSHELL DUMP /SNAPSHOT /F:C:\dumps /P:1234
```

*To disable creation of dump files, execute the command:*

```
KAVSHELL DUMP /OFF
```

## Importing settings: KAVSHELL IMPORT

The KAVSHELL IMPORT command lets you import the settings of Kaspersky Embedded Systems Security and its current tasks from a configuration file to a copy of Kaspersky Embedded Systems Security on the protected device. A configuration file can be created using the KAVSHELL EXPORT command.

A password might be required to execute the command. To enter the current password, use [/pwd: <password>].

## KAVSHELL IMPORT command syntax

```
KAVSHELL IMPORT <name of configuration file and path to file>
```

## KAVSHELL IMPORT command examples

```
KAVSHELL IMPORT Host1.xml
```

KAVSHELL IMPORT command-line parameter

Parameter	Description

<name of configuration file and path to file>

Name of configuration file used as the import source for settings.

System environment variables can be used when specifying the path to the file; user environment variables are not allowed.

[Return codes for the KAVSHELL IMPORT command.](#)

## Exporting settings: KAVSHELL EXPORT

The KAVSHELL EXPORT command lets you export all of the settings of Kaspersky Embedded Systems Security and its current tasks to a configuration file in order to import them later into copies of Kaspersky Embedded Systems Security installed on another protected device.

### KAVSHELL EXPORT command syntax

```
KAVSHELL EXPORT <name of configuration file and path to file>
```

### KAVSHELL EXPORT command examples

```
KAVSHELL EXPORT Host1.xml
```

KAVSHELL EXPORT command-line parameters

Parameter	Description
<name of configuration file and path to file>	Name of the configuration file that will contain the settings. Any file extension can be assigned to the configuration file. System environment variables can be used when specifying the path to the file; user environment variables are not allowed.

[Return codes for the KAVSHELL EXPORT command.](#)

## Integration with Microsoft Operations Management Suite: KAVSHELL OMSINFO

You can use the KAVSHELL OMSINFO command to review the status of the application and information about threats detected by anti-virus databases and the KSN service. The information about threats is taken from the available event logs.

### KAVSHELL OMSINFO command syntax

```
KAVSHELL OMSINFO <full path to generated file with file name>
```

### KAVSHELL OMSINFO command examples

```
KAVSHELL OMSINFO C:\Users\Admin\Desktop\omsinfo.json
```

KAVSHELL OMSINFO command-line parameter

Parameter	Description
-----------	-------------

<path to generated file with file name>

Name of the generated file that will contain information about the application status and any detected threats.

## Managing the Baseline File Integrity Monitor task: KAVSHELL FIM /BASELINE

You can use the `KAVSHELL FIM /BASELINE` command to configure the mode in which the Baseline File Integrity Monitor task runs and monitors the loading of DLL modules.

A password might be required to execute the command. To enter the current password, use `[/pwd: <password>]`.

### KAVSHELL FIM /BASELINE command syntax

```
KAVSHELL FIM /BASELINE [/CREATE: [<monitoring scope> | /L:<path to TXT file containing the list of monitoring areas>] [/MD5 | /SHA256] [/SF]] | [/CLEAR [/BL:<baseline id> | /ALIAS:<existing alias>]] | [/EXPORT:<path to TXT file> [/BL:<baseline id> | /ALIAS:<existing alias>]] | [/SHOW [/BL:<baseline id> | /ALIAS:<existing alias>]] | [/SCAN [/BL:<baseline id> | /ALIAS:<existing alias>]] | [/PWD:<password>]
```

### KAVSHELL FIM /BASELINE command examples

*To delete a baseline, run the following command:*

```
KAVSHELL FIM /BASELINE /CLEAR /BL:<baseline id>
```

You can configure Baseline File Integrity Monitor task settings using the command-line parameters (see the table below).

KAVSHELL FIM/ BASELINE command-line parameters/options

Parameter/option	Description
/CREATE	Create a new Baseline File Integrity Monitor task.  Kaspersky Embedded Systems Security will start the new Baseline File Integrity Monitor task in order to create a baseline.
/L	Specify the path to the TXT file containing the list of monitoring areas.
/MD5	Specify the MD5 algorithm for calculating a checksum (optional parameter).  /MD5 parameter can not be used together with /SHA256. MD5 algorithm is used by default.
/SHA256	Specify the SHA256 algorithm for calculating a checksum (optional parameter).  /SHA256 parameter can not be used together with /MD5. MD5 algorithm is used by default.

/SF	Includes all subfolders in the Baseline File Integrity Monitor task scope (optional parameter). By default all subfolders are excluded from the Baseline File Integrity Monitor task scope.
/CLEAR	Delete the baseline with specified <baseline id> or the baseline for the task with specified <existing alias>. Delete all baselines if neither <baseline id> nor <existing alias> was specified. Optional parameter.
/BL	Specify the unique ID of a baseline (optional parameter).
/EXPORT	Export the data about all baselines in a TXT file.
/SHOW	Show data about all baselines.
/SCAN	Start the new Baseline File Integrity Monitor task with specified <baseline id> or specified <existing alias>.
/ALIAS	Specify the name of an existing task or the name for a new task.
<monitoring scope>	Specify the file or folder that you want to include in the Baseline File Integrity Monitor task scope.  This parameter allows to specify only one area.
<path to TXT file containing the list of monitoring areas>	Specify the path to the TXT file containing the list of monitoring areas.  The file must be UTF-8 encoded, and each path to a monitoring area must be specified in a separate row.
<path to TXT file>	Specify the path to the file to which you want to export the data about all baselines.
<baseline id>	Specify the unique ID of a baseline. You can use the /SHOW parameter to learn the ID of a baseline.
<existing alias>	Specify the name of an existing task.
<new alias>	Specify the name of a new task.

## Command return codes

### Return codes for the KAVSHELL START and KAVSHELL STOP commands

Return code for the KAVSHELL START and KAVSHELL STOP commands

Return code	Description
0	Operation completed successfully
-3	Permission error
-5	Invalid command syntax
-6	Invalid operation (for example, the Kaspersky Security Service is already running or already

	stopped)
-7	Service not registered
-8	Automatic Service startup is disabled.
-9	Attempt to start the protected device under another user account failed (by default, the Kaspersky Security Service runs under the Local system user account)
-99	Unknown error

## Return code for KAVSHELL SCAN and KAVSHELL SCANCritical commands

Return code for the KAVSHELL SCAN and KAVSHELL SCANCritical commands

Return code	Description
0	Operation completed successfully (no threats detected)
1	Operation canceled
-2	Service not running
-3	Permission error
-4	Object not found (file with the list of scan scopes not found)
-5	Invalid command syntax or scan scope not defined
-80	Infected and other objects detected
-81	Probably infected objects detected
-82	Processing errors detected
-83	Unscanned objects found
-84	Corrupted objects detected
-85	Failed to create task log
-99	Unknown error
-301	Invalid key

## Return codes for the KAVSHELL TASK LOG-INSPECTOR command

Return code for the KAVSHELL TASK LOG-INSPECTOR command

Return code	Description
0	Operation completed successfully
-6	Invalid operation (for example, the Kaspersky Security Service is already running or already stopped)
402	Task is already running (for the /STATE option)

## Return codes for the KAVSHELL TASK command

Return codes for the KAVSHELL TASK command

Return code	Description
0	Operation completed successfully
-2	Service not running
-3	Permission error
-4	Object not found (task not found)
-5	Invalid command syntax
-6	Invalid operation (for example, task not running, already running, or cannot be paused)
-99	Unknown error
-301	Invalid key
401	Task not running (for the /STATE option)
402	Task already running (for the /STATE option)
403	Task already paused (for the /STATE option)
-404	Operation failed (a change in task status resulted in a crash)

## Return codes for the KAVSHELL RTP command

Return codes for the KAVSHELL RTP command

Return code	Description
0	Operation completed successfully
-2	Service not running
-3	Permission error
-4	Object not found (one or all of the Real-Time Computer Protection tasks not found)
-5	Invalid command syntax
-6	Invalid operation (for example, the task is already running or already stopped)
-99	Unknown error
-301	Invalid key

## Return codes for the KAVSHELL UPDATE command

Return codes for the KAVSHELL UPDATE command

Return code	Description
0	Operation completed successfully

200	All objects are up-to-date (database or program components are current)
-2	Service not running
-3	Permission error
-5	Invalid command syntax
-99	Unknown error
-206	Extension files are missing in the specified source or have unknown format
-209	Error while connecting to the update source
-232	Authentication error while connecting to proxy server
-234	Error while connecting to Kaspersky Security Center
-235	Kaspersky Embedded Systems Security was not authenticated when connecting to the update source
-236	Application database is corrupted
-301	Invalid key

## Return codes for the KAVSHELL ROLLBACK command

Return codes for the KAVSHELL ROLLBACK command

Return code	Description
0	Operation completed successfully
-2	Service not running
-3	Permission error
-99	Unknown error
-221	Backup copy of database not found or corrupted
-222	Backup copy of database corrupted

## Return codes for the KAVSHELL LICENSE command

Return codes for the KAVSHELL LICENSE command

Return code	Description
0	Operation completed successfully
-2	Service not running
-3	Insufficient privileges to manage keys
-4	Key with specified number not found
-5	Invalid command syntax
-6	Invalid operation (key already added)
-99	Unknown error
-301	Invalid key

## Return codes for the KAVSHELL TRACE command

Return codes for the KAVSHELL TRACE command

Return code	Description
0	Operation completed successfully
-2	Service not running
-3	Permission error
-4	Object not found (path specified for the trace log folder not found)
-5	Invalid command syntax
-6	Invalid operation (attempt to execute the KAVSHELL TRACE /OFF command when trace logs are already disabled)
-99	Unknown error

## Return codes for the KAVSHELL FBRESET command

Return codes for the KAVSHELL FBRESET command

Return code	Description
0	Operation completed successfully
-99	Unknown error

## Return codes for the KAVSHELL DUMP command

Return codes for the KAVSHELL DUMP command

Return code	Description
0	Operation completed successfully
-2	Service not running
-3	Permission error
-4	Object not found (path specified for dump file folder not found; process with specified PID not found)
-5	Invalid command syntax
-6	Invalid operation (attempt of KAVSHELL DUMP/OFF command execution if dump file creation is already disabled)
-99	Unknown error

## Return codes for the KAVSHELL IMPORT command

Return codes for the KAVSHELL IMPORT command

Return code	Description
0	Operation completed successfully
-2	Service not running
-3	Permission error
-4	Object not found (unable to find a configuration file that can be imported)
-5	Invalid syntax
-99	Unknown error
501	Operation completed successfully with an error/comment, for example, Kaspersky Embedded Systems Security did not import parameters for some functional component
-502	Import file is missing or has an unrecognized format
-503	Incompatible settings (configuration file exported from a different program or a later and incompatible version of Kaspersky Embedded Systems Security)

## Return codes for the KAVSHELL EXPORT command

Return codes for the KAVSHELL EXPORT command

Return code	Description
0	Operation completed successfully
-2	Service not running
-3	Permission error
-5	Invalid syntax
-10	Unable to create a configuration file (for example no access to the folder specified in the path to the file)
-99	Unknown error
501	Operation completed successfully with an error/comment, for example, Kaspersky Embedded Systems Security did not export parameters for some functional component

## Return codes for the KAVSHELL FIM /BASELINE command

Return codes for the KAVSHELL FIM /BASELINE command

Return code	Description
0	Operation completed successfully
-2	Service not running

-3	Permission error
-4	Object not found (task not found)
-5	Invalid command syntax
-6	Invalid operation (for example, the baseline already was deleted)
-10	Unable to create a configuration file (for example no access to the folder specified in the path to the file)
-12	Invalid password
-80	Inconsistent with the baseline objects detected
-85	Failed to create task log
-99	Internal error
-303	Invalid license key
-502	Task not running
200	All objects are consistent with the baseline
501	Task completed successfully with an error/comment

# Contacting Technical Support

This section describes the ways to receive technical support and the conditions on which it is available.

## How to get technical support

If you cannot find a solution to your problem in the application documentation or in one of the sources of information about the application, we recommend that you contact Technical Support. Technical Support specialists will answer your questions about installing and using the application.

Technical support is available only to users who have purchased a commercial license for the application. Technical support is not available to users who have a trial license.

Application support is provided according to the application lifecycle (see the [application lifecycle page](#)).

Before contacting Technical Support, please read through the [Technical Support rules](#).

You can contact Technical Support by sending a request to Kaspersky Technical Support through the [Kaspersky CompanyAccount portal](#).

## Technical Support via Kaspersky CompanyAccount

[Kaspersky CompanyAccount](#) is a portal for companies that use Kaspersky applications. Kaspersky CompanyAccount is designed to facilitate interaction between users and Kaspersky specialists via online requests. Kaspersky CompanyAccount lets you monitor the progress of electronic request processing by Kaspersky specialists and store a history of electronic requests.

You can register all of your organization's employees under a single user account on Kaspersky CompanyAccount. A single account lets you centrally manage electronic requests from registered employees to Kaspersky and also manage the privileges of these employees via Kaspersky CompanyAccount.

Kaspersky CompanyAccount is available in the following languages:

- English
- Spanish
- Italian
- German
- Polish
- Portuguese
- Russian
- French

- Japanese

To learn more about Kaspersky CompanyAccount, visit the [Technical Support website](#) <sup>↗</sup>.

## Using trace files and AVZ scripts

After you report a problem to Kaspersky Technical Support specialists, they may ask you to generate a report with information about the operation of Kaspersky Embedded Systems Security and to send it to Kaspersky Technical Support. Kaspersky Technical Support specialists may also ask you to create a trace file. The trace file allows following the process of how application commands are performed, step by step, in order to determine the stage of application operation at which an error occurs.

After analyzing the data you send, Kaspersky Technical Support specialists can create an AVZ script and send it to you. With AVZ scripts, it is possible to analyze active processes for threats, scan the protected device for threats, disinfect or delete infected files, and create system scan reports.

# Glossary

## Active key

A key that is currently used by the application.

## Administration Server

A component of Kaspersky Security Center that centrally stores information about all Kaspersky applications that are installed on the corporate network. It can also be used to manage these applications.

## Anti-virus databases

Databases that contain information about computer security threats known to Kaspersky as of when the anti-virus databases are released. Entries in anti-virus databases allow malicious code to be detected in scanned objects. Anti-virus databases are created by Kaspersky specialists and updated hourly.

## Archive

One or more file(s) packaged into a single file through compression. A dedicated application, called an archiver, is required for packing and unpacking the data.

## Backup

A special storage for backup copies of files, which are created before disinfection or deletion is attempted.

## Disinfection

A method of processing infected objects that results in full or partial recovery of data. Not all infected objects can be disinfected.

## Event severity

Property of an event encountered during the operation of a Kaspersky application. There are the following severity levels:

- Critical event
- Functional failure
- Warning

- Info

Events of the same type can have different severity levels depending on the situation in which the event occurred.

## False positive

A situation when a Kaspersky application considers a non-infected object to be infected because the object's code is similar to that of a virus.

## File mask

Representation of a file name using wildcards. The standard wildcards used in file masks are \* and ?, where \* represents any number of any characters and ? stands for any single character.

## Heuristic analyzer

A technology for detecting threats about which information has not yet been added to Kaspersky databases. The heuristic analyzer detects objects whose behavior in the operating system may pose a security threat. Objects detected by the heuristic analyzer are considered to be probably infected. For example, an object may be considered probably infected if it contains sequences of commands that are typical of malicious objects (open file, write to file).

## Infectable file

A file that, due to its structure or format, can be used by criminals as a "container" to store and spread malicious code. As a rule, these are executable files, with such file extensions as .com, .exe, and .dll. The risk of penetration of malicious code into such files is quite high.

## Infected object

An object of which a portion of code completely matches part of the code of known malware. Kaspersky does not recommend accessing such objects.

## Kaspersky Security Network (KSN)

An infrastructure of cloud services that provides access to the Kaspersky database with constantly updated information about the reputation of files, web resources, and software. Kaspersky Security Network ensures faster responses by Kaspersky applications to threats, improves the performance of some protection components, and reduces the likelihood of false positives.

## License term

A time period during which you have access to the application features and rights to use additional services. The services you can use depend on the type of the license.

## Local task

A task defined and running on a single client computer.

## OLE object

An object attached to another file or embedded into another file through the use of the Object Linking and Embedding (OLE) technology. An example of an OLE object is a Microsoft Office Excel® spreadsheet embedded into a Microsoft Office Word document.

## Policy

A policy determines an application's settings and manages the ability to configure that application on computers within an administration group. An individual policy must be created for each application. You can create multiple policies for applications installed on computers in each administration group, but only one policy can be applied at a time to each application within an administration group.

## Protection status

Current protection status, which reflects the level of computer security.

## Quarantine

The folder to which the Kaspersky application moves probably infected objects that have been detected. Objects are stored in Quarantine in encrypted form in order to avoid any impact on the computer.

## Security level

The security level is defined as a pre-configured set of application component settings.

## SIEM

A technology that analyzes security events originating from various network devices and applications.

## Startup objects

A set of applications needed for the operating system and software that is installed on the computer to start and operate correctly. These objects are executed every time the operating system is started. There are viruses capable of infecting such objects specifically, which may lead, for example, to blocking of operating system startup.

## Task

Functions performed by the Kaspersky application are implemented as tasks, such as: Real-time file protection, Full computer scan, and Database update.

## Task settings

Application settings that are specific for each task type.

## Update

The procedure of replacing or adding new files (databases or application modules) retrieved from the Kaspersky update servers.

## Vulnerability

A flaw in an operating system or an application that may be exploited by malware makers to penetrate the operating system or application, and corrupt its integrity. The presence of a large number of vulnerabilities in an operating system makes it unreliable, because viruses that penetrate the operating system may cause disruptions in the operating system itself and in installed applications.

## Information about third-party code

Information about third-party code is contained in the file `legal_notices.txt`, in the application installation folder.

## Trademark notices

Registered trademarks and service marks are the property of their respective owners.

Dell Technologies, Dell, EMC, Celerra, and VNX and other trademarks are trademarks of Dell Inc. or its subsidiaries.

Domino, Lotus and Lotus Notes are trademarks of International Business Machines Corporation, registered in many jurisdictions worldwide.

Intel, Pentium are trademarks of Intel Corporation in the U.S. and/or other countries.

Linux is the registered trademark of Linus Torvalds in the U.S. and other countries.

Microsoft, Active Directory, Forefront, Excel, Hyper-V, Internet Explorer, Jscript, Lync, Powershell, Outlook, SharePoint, SQL Server, Windows, Windows Server, Windows Vista, Windows XP are trademarks of the Microsoft group of companies.

NetApp is the trademark or the registered trademark of NetApp, Inc. in the United States and/or other countries.

Schneider Electric is a trademark of Schneider Electric.

Siemens, WinCC, Simatic are registered trademarks of Siemens AG.

CVE is a registered trademark of The MITRE Corporation.

UNIX is a registered trademark in the United States and other countries, licensed exclusively through X/Open Company Limited.
